third more than the statute acre, or 200 quarters nothing if not practical,) with an excursive and the whole 25 acres; this produce, according to doubtful argument, had commenced with the average price in 1813, would amount to £410; cause or causes, of want of health in fruit trees but at the average price of 1822, it is only worth in general, in order to proceed to the best possi-£200, hence there is a loss in value of £210 from ble modes of remedying the evils when found to the first price. Now we will suppose the rent of exist; for unless a departure from nature (in this farm at £3 per acre, which on 25 acres will several ways,) be the origin of this, why should amount to £75, so that we find there is a loss of fruit trees need restoring to health more than the £135 on 25 acres, over and above all the rent, betwixt the prices in 1818 and 1822. If we should est trees, is to plant them small: who would take allow the farmer the extravagant profit of £135 on oaks of five feet long, with each a little bunch of tions of the soil are affected nearly in the same squares of a foot or eighteen inches, and all the proportion, whilst the tithes remain the same as lateral branches trimmed off? The truth is, in most prosperous times, (nay, many of the that they often bend through natural weakness. in provisions, hay, &c. at the following different Clergy are become more oppressive,) and the periods; first, the months of February, 1814, poor rates have increased in an unparralleled deplaced. Where they stand in the nursery, they gree. Such is the present alarming change, that blow about with the wind, something like a crop of reed.

> When such trees are planted from a moderate soil into a good one (if well chosen and carefully planted,) they swell away pretty well. But when planted from a moderate soil into poorer,—ill chosen and ill managed, they barely keep alive two or three years, but swell nothing in the trunk. This must include such a degree of pining as is hardly curable. In all cases, where trees are unhealthy, and mossy, the causes are herein perceived very clearly, for if the trunk does not swell sufficiently, it cannot be clean; the bark efficacious at an early one: Mr. Lyon says he has and the bark thick, hard and corrugated, the struments.

To apply this reasoning, every one must take vania, who had advanced so far into civilization, his trees as he finds them; but to those who are as to be taught to plant apple-trees; but when he was recommended to prune them, he shook his more useful. On this division of the subject we head, and said,-"God knew best how apple- present our readers with the following detached

" The next cause (that is of want of bearing,) of our nurserymen and gardeners are well aware is constriction of the bark. This appears to be a of; for the greater part of the management that more frequent disease, and more dangerous than is applied to our fruit trees, is rendered necessary is commonly imagined. It is indicated by the From this table it appears that the average re-by their being removed out of a state of nature: unequal growth of the tree, in all parts, and most duction in the prices of the above three kinds of this departure from nature is two fold,—first, that Grain is more than 56 per cent.; and that the the trees are either raised or planted on unsuita- choice of stocks, therefore, will be, such as grow quantity of Grain which the farmer in 1813 got ble soils; second, that they are trained to walls most equally with the grafts to be put upon £100 for, he can now obtain only £44. So that it or trellises. The first of these branches into two them; by the tree swelling more where the bark is evident to the most common capacity, he must points of very great importance, namely, that the has been cut, or torn off by accident; by the sell above twice the quantity of grain now before standards for transplanting are raised in a manhe can raise the same sum he did in 1813. This ner totally different from that which nature would the bark appearing in different parts of the tree; Ibelieve every farmer experiences, and I assert without fear of contradiction, that what rents have been paid out of tenants capital, and not out of the paid out of tenants capital, and not out of the proceeds of the farm. Many people imagine

growing faster than others, and all growing faster laid aside as being tedious, and proof or slower, according to the soil or situation. It must therefore be regulated by the symptoms of constriction before mentioned, or as soon as the bark will admit of division. As the tree advances in age, the bark thickens and hardens; the peeling therefore must be carried further up eve-

"The practice of grafting shows that a stricture takes place very early; for I believe it will seldom succeed where the graft is more than one year old; and as it is better preventing diseases than curing them, it may be proper to remove have both produced fruit, and grown well to the

"In very young trees, a mere scraping, or taking off the transverse bark will be sufficient, and have wonderful effect in promoting the growth of the wood; but ought not to be done, till the month of March, when the sap has begun to be in motion to form a new bark; because if it is done much earlier, the inmost bark and alburnum long exposed to severe weather, may be dried and be rapidly advancing. The dry weather in the about as large as a honey bee. contracted, so as to become impervious to the sap.

"I now make it a regular practice to peel, or take the transverse bark off every tree I have, at two years old, that is, the second year from growth of the tree, and brings it sooner into bearing."

ETOMOLOGY OF RYE GRASS; the Agricultural common name of LOLIUM.

BY THE EDITOR.

The name of this grass (so long almost exclusively sown in lays) has at length generally set-tled into Rye-Grass, a spelling which seems to denote that it is some way referred to the cultivated grain, Rye, to which it bears no affinity Rye, and Ray; and these spellings are often all chine. The basement and second story are deposite in the same book. From the latter, some persons have supposed that the name was adopted in compliment to Ray, the celebrated Network.

ting down some seeds from a hay-loft, before a in making the various kinds of machinery for a lof the nose into the frontal sinus of the brain, a light wind; by which process, several times repeated, some clean heavy seeds were obtained, which could be commodiously sowed, and which speaking is of brick, the foundation of granite, speaking is of brick, the foundation of granite, which this operation was probably perserve by which have horns, there is a natural communication of the nose into the front the death of the animal. INSECTS THAT DESTROY SHEEP.

Messrs. Printers: The destruction of sheep, as published in your last paper, extracted from

There is a genus of insects called by naturala gloom over the hopes of the husbandman, was ists astrus or gad fly. In this and most other succeeded by plentiful rains; the products of countries they are very injurious to neat cattle, kind of insects, each of which has its peculiar pidity.

As evidence of the progress of manufactures, which it attacks. There is one which pierces I will mention an establishment which I visited the hides of our neat cattle, to deposit its eggs,

ing are manufactured and bleached per week .- times so numerous in the form of larva or worms. During the last season the company erected a that they destroy the coats of the stomach and

sons have supposed that the name was adopted in struction of the rolling mill is on a new princicompliment to Ray, the celebrated Naturalist, ple, having but one water wheel placed at the that animal, produces disease there, and frewho flourished from 1670 to 1700 or thereaside of the platform. About 1,000 tops of iron control of the rolling mill is on a new princianomy sheep, deposits its eggs in the nostrils of the platform. About 1,000 tops of iron control of the rolling mill is on a new princianomy sheep, deposits its eggs in the nostrils of the platform. About 1,000 tops of iron control of the rolling mill is on a new princiwho flourished from 1670 to 1700 or thereabouts, but of this I have not the shadow of proof.

I had occasion to observe several years ago, in answer to some observations of the late Dr. Richardson, on the neglect of single grasses, that the Rye-grass was undoubtedly first obtained by letting down some seeds from a hay-loft, before a light wind; by which process, several times represent the resulting on the placed at the that animal, produces disease there, and frequently destroys them. The blind staggers in rolled and slit at this mill per year. The third sheep is occasioned by this insect. The eggs are story is used as the nail factory, and from 6 to hatched into larva (grubs, or worms, or maggots,) which by their irritation excite inflammation and a running from the nose. When they are numerous thing down some seeds from a hay-loft, before a light wind; by which process, several times represent the producing that vertige or giddings which graces. ted by dissection.

In the season of the year when the sheep are attacked by this species of gad fly, their instinct generation. naturally leads them to avoid their enemies .-Accordingly when these insects are heard buzup the avenues of approach to their enemy.

With these facts before us, we have only to watch the enemy, at the season of his arrival, give him no entrance, but keep him at bay for a few weeks, till this short race is run. We know

THE MORALS OF AGRICTLTURE.

September 14th, 1822.

Most of these gentlemen appear to be so much at a loss for subjects, that their addresses many attempts to increase the fertility of the quently, of men. Famine marches after him, soil are ill judged, yet there are means enough and will not commit the less havock because he is able to keep beyond her reach.

F—, is remarkable for his kindness and litted by its exhaustion. The many then who berally a lest of charity to there he has long supported.

zing about them, sheep frequently start and run, from no apparent cause, but actually to shun But though the usual means may be the most rosity in his life. them. At such time, a fly of this kind will drive agreeable, I beseech your readers to believe F—, is directly the reverse of N—, in disthem from one place to another, and they are observed to hold their noses to the ground to shut true that no harvest can be reaped unless seeds no fondness for farming, his business has been enis not the greatest number of grains planted to the usual maxims which very naturally govern which ensures the heaviest crop of corn, but the means afforded for the support of the plants, by the degree of fertility in the soil. Just so fortune which their employer possessed, preof no better remedy than that of covering the of obtaining bread be increased in any country, er Virginia have done, on all of his annual innostrils of the sheep, with a list of gauzy suband its population will soon be equal to the crease, and part of his capital. But F—, is and its population will soon be equal to the crease, and part of his capital. But F—, is moderate in his desires, and therefore not of expand keeping it in its place by some adhesive substance. This is the only method that has suggested itself upon considering the nature of the case, and if it can possibly be done, it is recommended to practical men, as the only plausible remedy.

The american farmer.

The american farmer.

The morals of the sheep, with a list of galzy substance, through which the animal can breath, increased supply of food. On the contrary, if moderate in his desires, and therefore not of exponding the nature of the consequence must be a diminished population. These positions (which every sound political economist will sustain) shew what vast effects the labours of a single individual may have on the welfare of his country; and what beneficial effects might be produced, if it was believed (more especially by all law makers,) that he produced.

THE MORALS OF ACRICILTURE less pardonable than murder.

found there, as the writer hereof has demonstra- and that diminution is more effectual and per- public weal, it was without caring for it: his manent, than if he had confined his exertions views were exclusively directed to his own prito cutting twenty throats of every successive vate interest. He is obedient to the laws, and just and honest in all his dealings, because he To increase and multiply is a divine com-knows that such is his best policy; but in no case mand-and perhaps is the only command which does he allow his interest to yield to that of others,

are first sown-but every child knows that it tirely conducted by his overseers; and according with population. Only let bread, or the means vented him from living as most landholders in lowwho directly or indirectly lessens the produc-tiveness of the earth, is guilty of a sin far cording to the usual calculation of profit, injury to the land is not taken into consideration. It is MR. Editor,

I wish that some of your correspondents who have more leisure and more ability than myself, would take into consideration the subject on which I shall submit a few desultory remarks. If the morals of agriculture deserve marks. If the morals of agriculture deserve deserves to be revisionary to expect that the public good alone, mous conqueror and destroyer, Attila, "that the public good alone, mous conqueror and destroyer, Attila, "that the public good alone, mous conqueror and destroyer, Attila, "that the public good alone, mous conqueror and destroyer, Attila, "that the public good alone, mous conqueror and destroyer, Attila, "that the marks. If the morals of agriculture deserve visionary to expect that the public good alone, mous conqueror and destroyer, Attila, "that the not such attention on account of their importance, the subject is at least worth the notice, and is properly within the province of all authors of addresses to Agricultural Societies. A farmer can in no way do as much good for Notwithstanding his many virtues, he has to the this country, as by pursuing precisely that course the fullest extent which his means permitted, which is most profitable to himself. But though been the destroyer of grass, of grain, and consecutive of the country of men. Famine marches after him

should have something else to lay before his society and the public.

The Hindoos believe that whoever plants a tree, digs a well, and begets a child, is sure of admission into heaven. As ridiculous as this part of their religious creed may appear of hympon beings would well depend. this part of their religious creed may appear, of human beings would well depend.

for the purpose of thousands to do with my subject, except so far as the consequences of them affect the public good. F—, the course of two cultivators of my acquaintance, supports by his benevolence, twenty persons, and the strongest motives to induce every individual N—, inherited a farm and stock, capable of has destroyed the means of subsistence for 500, to increase the productiveness, population, and well supporting an industrious and economical which in effect, is equal to starving, or preventing wealth of his country. When our ancestors man, but which if left to the sole management of the existence of as many. N—, has given not emigrated, they wisely left behind them all an overseer, and treated according to the then thing in charity, but has given in the wages of their elfs, fairies, witches, &c., and as it is im-usual practice, would not have paid the expense labour more than F--'s wages and alms togethpossible that we can long remain as we now of cultivation many years. Fortunately he knew er: he has increased the production of the are, free from popular superstitions, it would be what course would most promote his interest.— earth enough for food for 500 persons, and therea blessing to our posterity if we were to adopt the Hindoo tenet, so modified as to suit our different situations. We have no want of growing three, nor of fresh water; and all experience before, and he has met with the success which no children. It is very true that these people trees, nor of fresh water; and all experience met will always be furnished mets (improperly so called) which promised not and so much the better. His improvements will not as fast as the food is necessary for their support, to return some clear profit on the control in the control of the has increased population to that amount, though not at all by the Hindoo mode, as he has before, and he has met with the success which no children. It is very true that these people the mets (improperly so called) which promised not and so much the better. His improvements will not as fast as the food is necessary for their support, to return some clear profit on the control in the control of as fast as the food is necessary for their support. to return some clear profit on the capital invest- die with him, nor will the corporeal powers of Population is always precisely proportioned to the means of subsistence, and in an agricultural country, must increase with the improvement of the soil, and decrease with its exhausting, derive the principal and which he was not 500 persons: if they were all drones, they would first cost. He bought no land which he was not 500 persons: if they were all drones, they would first cost. tion. The farmer who makes his land capable fully able to stock, or that would not yield more rather be an evil. But the people who eat N-'s, of producing annually 500 bushels of grain more clear profit, on the purchase money, than he could corn, are field labourers, mechanics, manufactuthan before his improvements commenced, increases permanently the population of his count
try by as many persons as his increased product will support. Another who spends his
provement, and purchase together, he makes
life in reducing the fertility of his soil to the
crops six times greater than when he commenced.

Though N—, has thus eminently promoted the number, by the births which have taken place

since they partook of his bounty. After his starve. They are not able to add any thing by Levi Pawling, George Sheaff, George Holstein, fire some considerable time, until some are their labour to the public stock, and though the and Richard B. Jones, Esquires, were constituted a committee to co-operate with such comther is cool there will be no further trouble habits of industry. Were all our land holders delphia, Bucks, Chester and Delaware Counlike N-, the wealth and population of the ties, and to meet on Saturday, the 19th of Ocstate would quickly be doubled. Were all like tober, at the sign of the Buck, near the 8th mile F—, with all his virtues, wealth and popula-tion would rapidly diminish, until the country lize an Association of practical farmers, for the became a desert. Thousands are pursuing the advancement of Agriculture and Rural Econoruinous course of the latter: very few cultivate my. their own.

My opinion on this subject, taught me to expect but little increase in the population of Virginia, and not to be disappointed in the report of trict would have suffered a considerable diminution. As much vacant land as this district contains, there is but little uncultivated, which (un- means of any of your correspondents. til enriched) will yield any clear profit. Therefore, Eastern Virginia, in its present state, is fully populated, and no increase can be expected, except from the improvements of the soil, and the consequent increased means of subsistence. entire failure. Certainly not a sufficient quantity of good wheat in the State for sowing.

To save trouble the price of this Bull is \$200. We export provisions it is true; this may at first seem to indicate a surplus of the means for subsistence, and a fund for additional population. But such a conclusion would be incorrect. Our surplus food is exchanged for clothing and other commodities, which in fact, or from custom, are as necessary as sufficient food. Our only consolation pass of a hundred miles square, as can be found lated countries.

have been committed by our legislatures, both banks of the hemp land. These streams are state and federal; it is enough to name as examples, the protecting duty policy, banking, and laws for the compulsory support of the poor. The last, though now the least of such evils, will hereafter become the heaviest. Poor laws impose taxes and penalties on honest induspance of the poor. The last, though now the least of such evils, will hereafter become the heaviest. Poor laws impose taxes and penalties on honest induspance of the poor the heavy numerous, and afford the most ample facilities for any kind of machinery.

There is nothing like agricultural enterprize yet to be found in this country, although we a few tolerably good farmers—none very laws impose taxes and penalties on honest induspance. laws impose taxes and penalties on honest indus-good. try, and offer rewards for idleness, extravagance, drunkenness, and debauchery-and their inevipursuing the some course, to the end. APPOMATTOX.

"reward, and shall determine and adjudge " whether any or either of the applicants be en-"the conditions thereto annexed." The directors shall then at a time to be fixed on by themselves award and distribute the premiums to

reward shall have been adjudged, and the nature, value and amount of such reward and for what it President. was granted.

SECT. IV. The directors shall prescribe and publish previous to the annual meeting, where the same shall be held, the rules, regulations, arrangements, and order of proceeding to be observed during the continuance of the annual meet-

SECT. v. The Directors shall provide and arrange suitable accommodations for the Cattle-Show, exhibition of manufactures and ploughing matches, to be held on the annual meetings.

SECT. VI. It shall be the duty of the directors, with such other persons as may be appointed for this purpose to examine into and report to to the President quarterly, as far as may be practicable, the state of agriculture and of the growing crops in those parts of the county as may come under their particular observation. To report all improvements in husbandry, the introduction of valuable trees, seeds and manures, of new and improved implements of agriculture, and any new improvement or invention, relating to manupay as long as he shall remain a member of the Society, the sum of one dollar or more, annually to the Treasurer thereof. preserved among the archieves of the Society .-The directors shall also at the annual meetings make a report to the Society of the general state of agriculture and manufactures in the county.

ARTICLE V.

SECT. 1. All the officers shall be elected by ballot, and due notice must be given of the hours

and place of holding the election.

Sect. II. The Directors shall appoint three disinterested persons to act as judges at the election, to receive and count the ballots, and to make a true return of the election.

SECT. III. The judges shall keep a correct list of the names of the voters, and of the number of votes given in for each officer, and deliver

the said list, tally-papers and return of the elec-on, certified by them, to the Secretary. Sect. IV. No person, shall be permitted to at any election for officers who shall or may

be in arrears for his annual subscription or any part thereof.

SECT. v. The treasurer shall furnish the judg. es of the election with a correct list of all delinquent subscribers, and the amount due from each.

ARTICLE VI.

Persons proposing for admission shall make application to the board of directors, through any member of the board, and shall be admitted by a Majority of the directors agreeing to the same.

ARTICLE VII.

All candidates or applicants for premiums shall make known his, her, or their intentions in writing at any time before 9 o'clock A. M. of the day appointed for holding the Cattle-Show and exhibition, giving a full and minute account of the article, production or improvement offered for premium, which description shall be registered by the secretary in a book to be kept for that purpose.

ARTICLE VIII.

The duties of the President shall be to preside at all meetings of the Society and of the directors-to superintend the general concerns of the society-to maintain all useful correspondence in relation to the objects of the Society, and make from time to time, such communications to the Society as he may deem useful and proper—call meetings of the directors when he shall think it necessary, or upon the written request of three directors; and shall on the request of a majority of the directors, call special meetings of the So-ciety. He shall certify all copies of the proceedings, of the directors of the Society and direct the seal of the Society to be affixed to the same when necessary.

ARTICLE IX.

SECT. I. The Secretary shall keep regular minutes of the proceedings of the directors, and

SECT. 11. It shall be the duty of the secretary to keep a book into which he shall register the names, occupations and residence of each and every applicant for rewards, together with a description and account of the article, production or improvement, such applicant may offer for pre-mium and also note to whom premiums may be awarded.

SECT. 11. The Secretary shall take charge of all the papers and documents belonging to the Society, and preserve all reports made by the directors and others and all essays that may be read in the Society in relation to agriculture, manufactures or any of the objects of the Society.

SECT. IV. The Secretary shall have the care f the books or Library, belonging to the Society, which he is authorised to give out to any member or members, or other persons subject to such regulations, as the directors may prescribe.

SECT. v. The Secretary shall have charge of the seal of the Society, and affix the same to such papers, or documents only, as the President may

Seeing no reason why our friends, the Farmers should not occasionally relish a good dish of humour, as well as as other folks—we expect their indulgence in copying from the Intelligencer an ingenious oratorical celebration of the powers, dignified propensities, uses, Natural History, and character of that important per-sonage—Mr. Hog—their great friend and stand-by, in good and bad times, especially in Maryland and Virginia. It will serve to shew them how much a sprightly imagination can find to say, on a gross subject, especially, when as in this case; it emanates from the fertile brains of a fat gentleman, a bon vivant and a liberale, judging from the oily flow of his wit, and the generous tenor of his allusions on reli-

The oration being rather long for this paper, we have omitted the conclusion of it, and have added some extracts, from venerable authority to shew, that the humorous author has not over-rated the dignity of his subject.

Edit. Am. Far.

THE HOG.

AN ORATION WRITTEN FOR MASTER T. J. L.*

Respected Preceptor, and beloved Classmates: Tired with having recourse to our school books for studied pieces of elocution, for our declama-tory exercises, which, though admired for their of the Society, keep a list of the members and tory exercises, which, though admired for the society, keep a list of the members and tory exercises, which, though admired for the sive due public notice of all meetings, he shall various beauties, have become in a manner uninteresting from continual repetition, I have ventured, like a nestling from the branch, to take a sive with a view to try my powers. flight of my own, with a view to try my powers. Should I, in this attempt, call forth your risible faculties, by blending together, in the repast I am about to offer you, the Hog and the Fine Arts, Gastronomy and Beauty, the Holy Alliance and to the fa Stump Orators, which I propose to serve up, after the German manner, garnished with American brains, and a few French nick-knacks, I must assure you that mirth is not my sole object: A moral, as you will find by listening to me with indulgence, may be drawn from a Pig, as well head, the house-maid, valet, chimney sweeper, as from the democratic Ant, or monarchical and shoe-black, are all indebted to him; while the

> the most unequivocal of any other. He is the sovereign of the cook-shop; without him we should have no lard, no forced meat balls, nor at a loss to know how to get into the subject, or

pigs—in short, no kitchen.
Your Willich's, Volneys, Buchans, and Meases, cryin vain that his flesh is heavy and laxative. Our Mitchills and Physicks, Huntts and Worthingtons, may tell us, if they please, that it

Lest the author should be considered as a finished Gastronome, it is but in justice to himself, as well as to the inimitable author of the Almanac des Gourmands, to state, that he is indebted to that amusing work for many of the culinary and other articles to be found in this Eulogy.

is indigestible and scorbutic; we know they would be very sorry were we to believe them; for, on the score of bilious fevers and dyspensies, the hog is the best feather in their caps. The Jews, though they regard him with horror, as do some Christians, (many of whom are perfect Jews, while many Jews excel the Christians in the practice

of every virtue,) yet neither will hesitate to eat good blood puddings, when they can get them.

If you want to learn the value of the Hog, consult the French cook, who knows how to dress eggs in six hundred and eighty five different ways, and he will tell you that the artist alone is at the head of the culinary profession who has triumphed over every obstacle, by varying his compositions in such a manner as to give the flesh of the Hog the most learned, exquisite, and multiplied forms.

" To mix the food by vicious rules of art, To kill the stomach, and to sink the heart; To make mankind to social virtue sour, Cram o'er each dish, and be what they devour, From this the kitchen muse first framed her book,

Commanding sweet to stream from every cook : Children no more their antic gambols tried, And friends to physic wonder'd how they died."

Thus sang our inimitable Hasty-pudding bard; and yet, had we asked him to name his favorite dish, he would have answered, Pork and Beans, with the same simplicity as he informed us that all his bones were made of Indian corn. Put the same question to a member from the 'Ancient Dominion,' and he will tell you Hog and Homony; to one from Maryland, and he will answer, the wing of a Mud Lark; to the chairman of a committee, who maintains that there is no report like the report of a cork, 'no digest of laws like the laws of digestion,' and he will reply Ham and Chickens. Even the Judge who lost his hat the other day in a rencontre with a drove of these sturdy grunters moving heedlessly down the Pennsylvania avenue to the pot, the stew-pan, smoke house, harness-tub, and spit, will say, Bacon and Eggs.

Nature has so arranged it, that every part of the Hog is good—there is nothing in him to re-ject. The fine arts have disputed with the kitchen the honor of stripping him, and while many a 'knight of the dishclout' owes his fortune to the Hog, his bristles have been the instrument of the glory of a West and a Trumbull, and have added to the fame of many an epic poet, in a choice me-

" Thy hair so bristles with unmanly fears As fields of corn that rise in bearded ears."

The gouty nabob's limbs, the dapper dandy's and shoe-black, are all indebted to him; while the Bee.

The Hog is the king of all unclean animals; his empire is the most universal, and his qualities never kissed, perhaps never shall, owes half its sweetness to the Hog.‡

fixed ammunition for the frying pan; no roast at which end to take him. If we begin at the most noble part, we shall discover that, without much labor, it is transformed for the tables of princes, so as to resemble (which we hold contrary to the arts of civilization) the head of a wild Boar. His cutlets, whether broiled simple in *hapillote*, or served in *ragout*, are gratifying to our sensuality. His thighs and shoulders have contributed to the

\$ By the Tooth Brush.

Mud Lark-the Marylanders' term for Hog. Thus, the Wing of a Mud Lark, in the stang of the country, is a Ham.

manner of Saint Mince, are preferred by all the members of the Holy Alliance to that plain, though famous American dish, the Rights of Man, the stamina of all good constitutions, which the sovereign people will finally have to cram down their legitimate throats with less ceremony than we stuff young turkeys, before they know what is good for themselves and those who nour-

ish and support them. The Hog's haslet, intestines, web, and scrapings, form the essentials and tubes of all our sausages. Even his blood has the advantage over that of all other animals, of being turned divers ways to the cravings of our appetites. His meat, hashed fine, in addition to the various metamorphoses it is subjected to, is the principal ingredient of that exquisite stuffing which accommodates itself so marvellously to the cavities, of what to that boasting feeder John Bull is rara avis—a Roasted Turkey. His breast and middlings, when consigned to the pickle, are alike estimain a New England chowder; while if hashed in small cubes, and studded like pearls over the liver of a calf, the crested fricandeau rises to our view, to reign the queen of all the senses, and again, when cut in transparent slices to decorate the breasts of patridges, woodcocks, snipes, quails, ortolans, red birds, and such like supermayour to these roasted delights which the delicate palates of such renowned epicures as your Tom Brattles of America, D' Aigrefeuilles of France, and Quins of England, find incomparable. Shall we mention Brawn, his spare-rib, Chine, the rasher of bacon or pork, sprinkled with vinegar, and sweetened with all the boatmen's delight, and his head called, when deprived of all its bones a cheese? The year continuous losses a cheese? The year continuous as a specific roasted. The other roasted with combat-ants. It consisted of taking out all the insides of the Hog, and then forcing him, with every species of game and other victims, filling the creative with oysters, the whole moistened with cost-layer roasted. The other roasted. The other roasted. The other roasted with combat-ants. It consisted of taking out all the insides of the Hog, and then forcing him, with every species of game and other victims, filling the creative with roasted. The other roasted roaste latives of the table, they supersede the necessity a cheese? The very gastric juice of a true Gastronome, on his beholding it, rises to the mouth,

Then comes his skin to form the Borachos, in which the Spanish and Portuguese vintagers transport their generous wine, called by an old Chanoine the milk of the aged, the balsam of the adult, and the vehicle of the epicure. Then again it is destined for the creble and the seive, and served up to all sinners. finally, to prove its superior excellence, on the saddle of the horseman. In this shape how many stump orators it takes astride, and bears along through bog and briar, in Indian track, and over turnpike, vexing, by its durability and pliability, the coarser texture of its rough neighbors, until by "stooping down, as he must needs who can-not sit upright," these idols of the people arrive, with their noble suffering parts, at the crimson seat of honor.

impatient to envelope it.

In short, from the St. Croix to the Mississippi, from the Blue Ridge to the Rocky Mountains, what would man be without his Hog? His virtues and his worth are known to all, from the Mayor of New York, for whom he has long officiated as scavenger general, to that hardy ocean-troubler, the Marblehead fisherman, of whose Cod he is the aid-de-camp; and, though all are indebted to him for so many enjoyments, yet they never mention him but in the language of abuse, and never cease to load his name with the most opprobrious terms.

Not so the ancients. They honored him by sacrificing him to Ceres, the goddess of abundance, for having taught man how to plough the carth. The Egyptians sacrificed him to the full moon and to Bacchus. They regarded him, too, as the symbol of intrepidity, and when in his fury

riches and reputation of Virginia, Westphalia, ravaging vineyards and harvests, as a superb and think that to him, nstead of the lion, belongs the sage historians. What school-boy does not recollect the inspi-

neas, foretelling the hero that his wanderings would not cease until he should espy the predes-

In Rome, the Hog was held in the highest estimation, and there the most particular attention ble, whether garnished with greens or engulphed emperors, the vulgar luxury of Glutony, (for a dest treatment for the love of kin. fine polished Gastronome was not known in those days,) was carried to great excess, even to a cruelty too disgusting to mention. Among the opulent ferocious Romans, (as Lady Morgan very properly styles them,) they had two celebrated ways of preparing and cooking a hog—one consisted in serving him up, as large as life, with one side boiled and the other roasted. The other of the Hog, and then forcing him, with every mon to many. As Nature herself, however, has species of game and other victims, filling the credrawn no very exact line of distinction because of the control of the contro

> Eastern Shore of Maryland, boast of their roasted Hogs, after the West India manner, but we suspect they never heard of such barbecues as these, which appear to us to be as extraordinary as the infernal Venison—a roasted tiger stuffed with

It appears from various historians that, among the less ancient people of Europe, pork was held in such high repute as to form, (as in our new settlements,) not only their common food, but also the principal article of their best repasts.— The Salique law treats more of the Hog than of any other domestic animal. One of its chapters is confined altogether to the punishment of hog stealing—de furtis porcorum. Formerly the greatest revenues of the Mother church consisted in her hog tithes. In those days the corpu-lent priests of France, who "larded the lean earth as they walked along," and whose tutelar Saint* has ever since been represented by artists with a Hog at his feet, were so fond of Pork, that the dishes destined to bear it to the table were called Bacconiques, from the old worp Baccon or Bacon, which signified a fatted pork or Hog. It was then these bon vivans daily invoked their guardian,

" That their life, like the leap of their patron might be,

Du lit a la table, de la table au lit."

After all that has been said of the utility of the

From the bed to the table, the table to the bed stention in breeding.

riches and reputation of Virginia, Westphalia, ravaging vineyards and harvests, as a superd and Bayonne. His ears and tongue are tidbits cruel conqueror, though they at the same time title of the king of animals; in point of instinct, when operated upon by an expert cook; and his uprights, when dressed after the consummate manner of Saint Mince, are preferred by all the members of the Holy Alliance to that plain, the was immolated on wedding days, dog, beaver, and half-reasoning elephant. He was also sacri- has not heard of the learned Pig spelling words, ficed to Diana, and in the Island of Crete he was pointing out names, and designating cards? In considered as a sacred animal. In short, he has the towns of Europe, when the swineherd sounds been sung over by High Priests, immortalized his horn, every Hog leaves his stye to follow him by Poets, and his virtues have been recorded by to the forest or fields. If a storm is approaching, or a change of wind or weather is about to take place, the Hog is the first with his Baromered seer, who read the oracles of destiny to Æ-ter nose, true as Torricelli's best instrument, to make the discovery and to warn his keeper by his cries and movements. With a knowledge of tined, infallible signals of civilization and future this fact, the conjurers tell us, "he is the only grandeur, a white sow recumbent with her litter animal who sees the wind," by which means he of pigs, emblem of a multiplying people, the is enabled, on the principle of carpe diem, to avoid foul weather, and enjoy the fine. He is also avoid foul weather, and enjoy the fine. He is also endowed with sensibility as well as instinct, and has one quality which distinguishes him from all was paid to the art of cleaning, feeding and fatten-ing him; an art, which the Latin authors on the aid of all his brother hogs in distrees and dif-rural economy called *Porculantio*. Under the ficulty, braving the greatest dangers and the ru-

OF THE NATURAL HISTORY OF THE HOG.

Before we proceed to the chief design of this work, which is to treat of the Breeding of Swine, the following account of the natural history of the animal may not be unacceptible to

the reader.

To facilitate the study of Natural History, its various objects have been divided into class es, by selecting the properties which are comtween the different species of animals, it is often ly wines and rich juices. This preparation of the difficult to determine to which class some ani-Trojan Hog led to such extravagancies that it bemals belong, or which they most resemble; of this the hog, or swine, is a remarkable example. It is like the animals of the horse kind in the number of its teeth; in the length of its head; and in having but a single stomach: it is like the animals of the cow kind in its cloven hoofs, and in the position of the in-testines; and it is like the animals of the claw tenpeany nails, which a terrific itinerant preachfooted kind, as the lion, the cat, and the dog,
for once told his hearers his Satanic Majesty
in its appetite for flesh, in not chewing the cudy

and in its numerous progeny.

The animals of the hog kind, therefore, possess in the scale of existence a situation intermediate between those that live upon flesh, and those that live upon grass, being ravenous like the one and inoffensive like the other. Like, the rapacious kinds, and they are found to have short intestines; their hoofs also, though cloven to the sight, will, upon anatomical inspection, appear to be supplied with bones like beasts of prey; and the number of their teats also increase the similitude: on the other hand, in a natural state they live upon vegetables, and seldom seek after animal food, except when urged by necessity. They offend no other ani-mal of the forest, at the same time that they are furnished with arms to terrify the bravest.

The wild boar, which is the original of all the varieties we find in this creature, is by no means so stupid nor so filthy an animal as that we have reduced to tameness; he is much smaller than the tame hog, and does not vary in his colour* as those of the domestic kind

* Domestication and culture, gives diversity of form and colour to bird and beast-this cannot be denied, and warrants the inference that great improvements are yet to be made by at-Edit. Am. For.

as this turns up the earth in little spots here and there, so the wild boar plows it up like a furrow, and does irreparable damage in the cultivated lands of the farmer. The tusks also of this animal are larger than in the tame breed, some of them being seen almost a foot long. These, as is well known, grow from both the under and upper jaw, bend upwards circularly, and are exceeding sharp at the points. They differ from the tusks of the elephant in this, that they never fall; and it is remarkable of all the hog kind, that they never shed their of all the hog kind, that they never shed their trained are content to wait until the hunters eighteen or twenty years; and the females protecth as other animals are seen to do. The tusks of the lower jaw are always most to be and, after several blows, despatch or disable him, from ten to twenty young at a litter, and that

each other mutual assistance, calling to each other with a very loud and fierce note; the strongest face the danger; they form a ring, and the weakest fall into the centre.† In this position few ravenous beasts dare venture to attack them, but pursue the chace where there is less resistance and danger. However, when the wild boar is come to a state of maturity, and when conscious of his own superior strength, he then walks the forest alone, and fearless.

At the time he dreads no single creature, quadrupeds the most delicate in the choice of ring the day, he commonly remained in the

wild boar is one of the principal amusements of the nobility in those countries where it is to be found. The dogs provided for this sport are of the slow heavy kind. Those used for hunting the stag, or the roe-buck, would be very improper, as they would too soon come up with their prey; and, instead of a chace, would only furnish out an engagement. A small would only furnish out an engagement. A small hide, together with the thick coat of fat that mastiff is therefore chosen; nor are the hunters much mindful of the goodness of their nose, as the wild boar leaves so strong a scent that it. Its other senses seem to be in tolerable perfections. is impossible for them to mistake its course, tion; it scents the hounds at a distance; and, They never hunt any but the largest and the as we have seen, is not insensible in the choice oldest, which are known by their tracks. When of its provisions. When the wind blows with

sow, and the family lives in a herd together.

They are then called beasts of company, and unite their common forces against the invasions of the wolf, or the more formidable beasts of prey. Upon this their principal safety while ever animal happens to die in the forest, or is ownedded, they give comes a prey to the hor who seldon refused by rearing up her former number of the wolf of the wolf, or the more formidable beasts of prey. Upon this their principal safety while so wounded that it can make no resistance, beyoung depends, for when attacked they give comes a prey to the hog, who seldom refuses grand huntsman to chace that animal from the each other mutual assistance, calling to each animal food, how putrid soever, although it is middle of November to the beginning of De-At that time he dreads no single creature, quadrupeds the most delicate in the choice of ring the day, he commonly remained in the nor does he turn out of his way even for man what vegetables it shall feed on, and rejects a most sequestered part of the wood, and came most much seem to avoid it. He does not for instance, as we are assured by Linnzus, eats shun the combat even with the lion, if protwo hundred and sighteen, the goest eats form. voked; he does not seek him to attack, but two hundred and eighteen; the goat eats four will not fly at his approach; he waits the onset of the lion, which he seldom makes unless and twenty-six; the sheep has three hundred and compelled by hunger, and then exerts all his are forty-one; the horse eats two hundred and six-energh, and is sometimes successful. We are forty-one; the horse eats two hundred and six-energh, and is sometimes successful. We are forty-one; the horse eats two hundred and twelves the head sourced was a great delicacy;

the boar is rear'd, as is the expression of dri-ving him from his covert, he goes slowly and lently towards its sty, screaming horribly at the same time, which seems to argue that it is na-turally fond of a warm climate. It appears al-so to foresee the approach of bad weather, Edit. Am. Ear. bringing straw to its sty in its mouth, preparing

do, but is always found of an iron grey, inclining to black; his snout is much longer than that of the tame hog, and the ears thorter, rounder, and black; of which colour are also the feet and the tail. He roots the ground in a different manner from the common hog; for as this turns up the earth in little spots here and there, so the wild boar plows it up like each other, with mutual animosity, the boar have often also been known to grather round.

dreaded, and are found to give very terrible wounds.

The wild boar can properly be called neither a solitary nor a gregarious animal. The the testicles, which would otherwise give a merous they would shortly become, if not ditaint to the flesh; and the huntsmen celebrate ther a solitary nor a gregarious animal. The the victory with their horns. ther a solitary nor a gregarious animal. The the victory with their horns.

they are less prolific; and the sow of the woods brings forth but once a year, probably be-

told of the combat of a lion and a wild boar, in ty-two, and rejects two hundred and twelve; the boar's head soused was anciently the first a meadow near Algiers, which continued for but the hog, more nice in its provision than any dish on Christmas-day, and was carried up a long time with incredible obstinacy. At last, of the former, eats but seventy-two plants, and to the principal table in the hall with great both were seen to fall by the wounds they had given each other; and the ground all about them was covered with their blood.

This animal is therefore seldom attacked but at a disadvantage, either by numbers, or when found sleeping by moon-light. The hunting the wild boar is one of the principal amusements wind-fall.

In the or-state and solemnity. Hollingshed says, that in the year 1170, Henry I., upon the day of the young prince's coronation, served his son at table as sewer, bringing up the boar's head with trumbut a few hours on the ground, and continue pets before it, according to the manner. There on the watch whole hours together for a fresh is also a singular ceremony relating to the boar's head, still retained at Queen's College, in Ox-

Reddens Laudes Domino. The boar's head in hand bring I, With garlandes gay and rosemarye; I pray you all sing merrely,

Qui estis in convivio.

The boar's head, I understande, Is the chief servyce in this lande, Looke wherever it be fonde, Servite cum cantico.

Be gladde lordes, both more and less, For this hath ordained our Stewarde, To chere you all this Christmasse, The boar's head with mustarde.

[†] In single or associated combat the hog is a model of skill even for biped warriors.

absence of the old ones, and returned them

This Carol, says Mr. Warton, is still retained at Queen's College. There is indeed in the college an old legend, that a wild boar which intested the neighbourhood of Oxford, was killed by a taberdar of this college on Christmasday, as he was going to serve a church; and that he killed it by thrusting his copy of Aristotle down the throat of the animal, protecting his arm with some part of his gown. This story, it is probable, may have contribu-ted to the continuance of the ceremony of the boar's head at Queen's College longer than any where else. The song, however, has no allu-sion to it; it simply states, that the boar's head is the rarest dish in all this land, and that it has been provided in honour of the King of Bliss.

There is a song on this supposed feat of the taberdar, written by the present Dr. Harrington

IN HONOUR OF THE CELEBRATION OF THE BOAR'S HEAD,

AT QUEEN'S COLLEGE, OXFORD.

I sing not of Roman or Grecian mad games, The Pythian Olympic, and such like hard names; Your patience a while, with submission, I beg, Whilst I study to honour the feat of Cool Reg. Derry down, down, down, derry down.

No Thracian bowls at our rites e'er prevail, We temper our mirth with plain sober mild ale; The tricks of old Circe deter us from wine, Though we honour a boar we won't make ourselves swine.

Derry down, &c.

Great Milo was famous for slaying his ox, Yet he proved but an ass in the cleaving of blocks:

But we had an hero for all things was fit, Our motto displays both his valour and wit. Derry down, &c.

Stout Hercules labour'd, and look'd mighty big, When he slew the half-starved Erymanthian pig:

But we can relate such a stratagem taken That the stoutest of boars could not save his own bacon.

Derry down, &c.

So dreadful this bristle-back'd foe did appear, You'd have sworn he had got the wrong pig by the ear,

But instead of avoiding the mouth of the beast, He rammed in a volume, and cried Gracum est. Derry down, &c.

In this gallant action such fortitude shewn is, As proves him no coward, nor tender Adonis; No armour but logic, by which we may find That logic's the bulwark of body and mind. Derry down, &c.

Ye squires, that fear neither hills nor rough rocks And think you're full wise when you outwit a poor fox,

Enrich your poor brains, and expose them no more.

Learn Greek, and seek glory from hunting the

FROM THE NEW ENGLAND FARMER.

PREPARING FLAX.

We esteem ourselves fortunate in being permitted to lay before our readers the following S. W. Pomeroy, Esq. extracts from a correspondence between His Excellency the Governor of Connecticut, and S. W. Pomeroy, Esq. of this State. The subject is of great importance, and if it continues to engage the attention of men of mind, influence, character and standing, its discussion may be the means machines, came to hand a few days since.

Litchfield, Con. June, 25, 1822.

DEAR SIR,

The common process of rotting in the air, we the necessity of any preparation, and its success-know will never give us good Flax, and the ful operation confidently relied on, had an effect process of water rotting will not be practised to paralize all efforts of the kind.

From the best information I was able to colble and unhealthy business to those employed lect, before my Essay went to press, I felt a

finding out a mode by which common farmers in poor houses and cottages, was not sufficient, can extract the gluten, and weaken the woody I have since received intelligence from a source fibre, so as to render Flax, after being stripped entitled to confidence, that places the question of its seeds, manageable by such operations or beyond all doubt. An acquaintance with a gen-

nous matter, and sufficiently weaken the woody of bleaching with the oxi muriate of lime, by fibre, after being merely dried in the air: Will which linen, even from dew rotted flax, is bleachit fix the colour of the plant? The Flax, before ed nearly as cheap as cotton, and, if judicious-steaming, may be soaked in weak lye, with or without lime or lime water, and with, or without lime or lime water, and with, or without soap suds, and urine. Near the coast, salt cloth made from bleached flax must be submitted water, with and without the combinations before to a similar process before it is made up for mentioned, may be useful.

Any of the chymical processes of bleaching, when it has been prepared as an article of com-

castrated and young boar, not exceeding a year back to the woods, where they grew fat, and old, makes delicate eating. The ancients castheir pork was much better than that of the derstand, were prepared in Hill and Bundy's Matrated young boars, which they carried off in the common hogs. been rotted; and the white is the same article, after being bleached, by means of soap suds, or a weak solution of muriatic acid.

Your friend and Obedient servant, OLIVER WOLCOTT.

Brighton, 14th July, 1822.

DEAR SIR,

Your highly valued favour of 29th ult. with samples of Flax, prepared in Hill and Bundy's

of giving a new staple to New England of little if any less importance than cotton or tobacco to Southern sections of the Union.—Ed. N. E. F. Massachusetts Agricultural Societ, promulgated the offer of liberal rewards for the best experiments on the preparation of Flax, by boiling, steaming or any other than the usual mode.-I have read with great satisfaction your Essay Though the quantity required was only 75 lbs. on the Cultivation of Flax, and consider it as the and the period for receiving it continued till of Bath, and printed in the "Oxford Lausage," best I have seen; what we now want, is a distinct the middle of January, none was exhibited; so full of wit and humour, that we assure ourselves our readers will not be displeased to find it inous matter, and decomposing the woody fibre, bounds, there is reason to believe that the public annexed to this note. process of bleaching, difficult and expensive. Macdonald, of a machine that would supercede

in it, and besides poisonous to our streams of strong conviction that the machines of Hill and water.

Strong conviction that the machines of Hill and Bundy could not be made extensively useful in The extension of our Flax culture, will, in this country; and if their neglect in Great Britain, my opinion, greatly depend upon our success in except for employing infirm people and children machines, as can be introduced into common tleman of respectability, lately arrived from use.

England, has furnished interesting facts con-The practical question is therefore, does there, nected with the present subject, some of which sively engaged in the manufacture of linen by You live in a part of our country which is machinery at Leeds. He says that "spinning deeply interested in this question. You, more by hand is mostly abandoned; that last year influence.

I therefore take the liberty to request your particular attention to this interesting subject. I feel confident that the thing desired can be done, making the subject of dressing and bleaching the subject of dressing and bleaching the subject. but I cannot command the means of making the by them being sixpence sterling per pound—" necessary experiments: I can only suggest hints, which may be useful.

Flax may, in mass, be subjected to the action of steam. This may of itself extract the gluti-the discovery and improvements in the process. market.

I coincide in the opinion you have expressed, may, for ought I can perceive, be as well ap-plied to Flax in mass, before it is broken and greatly depend upon finding out a mode by dressed, as afterwards. A question must how-which common farmers can extract the gluti-Sir, that "the extension of flax culture will ever arise, respecting the expences of all the nous matter and weaken the woody fibre, so as processes, compared with the value of the Flax, to render the flax manageable by such operations or machines as can be introduced into common use," and sincerely regret my inability

to adduce facts in answer to your question, ed by his machine, "are abundant in every does there or does there not exist in nature a farmer's house." I shall be much mistaken in swer the purpose; in that case the expense to flax, in mass, by operative farmers?" Feeling like yourself, confident that "the thing desired can be done," and, although possessed of the substances used in bleaching will, I beside the size of the substances used in bleaching will, I beside the size of the substances used in bleaching will, I beside the size of the size of the substances used in bleaching will, I beside the size of the substances used in bleaching will, I beside the size of the substances used in bleaching will, I beside the size of the substances used in bleaching will, I beside the size of the si

in the successful operation of his machines for swers the same purpose—is more convenient separating the fibre or harle from the stem of the plant, yet the very important process of cleansing it from the glutinous matter remains to be performed, and the question occurs, "canpound—one pound of which is said to be sufficient to acidulate two hundred collaps of water. With respectful and sincere attachment. not this be done, in the large way as cheap, and cient to acidulate two hundred gallons of water. with much less hazard by common farmers with It is pronable nowever that it is pronable now that it is pronable no with much less hazard by common farmers with It is probable however that five pounds to that can. The only objection is the expense and cess.
incovenience of managing a more bulky article; but will not the dressed flax require equal preparation of flax by the usual method of labour in dividing it into minute parcels for the steeping in water, it appears that it is the acid cleausing process, and uncommon care in hand-ling and drying to prevent immense waste? By solves the glutinous matter; the mere act of applying the solvent to the stem, it is reasonable fermentation has no other effect than to give to suppose that the "woody fibre" would be motion to the liquid, as has been demonstrated tween Gov. Wolcott and Mr. Pomeroy, containweakened to such a degree that much less powby eminent bleachers in Great Britain when ed in your paper, which I received yesterday.—

It is not probable that the end we are seeking will be efficiently attained without the aid of heat. Steam even from pure water is a most powerful solvent; and I have great faith that with a proper menstruum, it may be successfully applied by common farmers. I am led to this conclusion by its operation with a perfectly simple apparatus in washing clothes—by far the greatest and most economical improvement yet discovered to disarm washing day of its terrors. It should be kept in view, that there is a why chlorine or oxymuriatic acid gas may not steeping. It should be kept in view, that there is a why chlorine or oxymuriatic acid gas may not It consists of a pot or boiler with a close cover It consists of a pot or boiler with a close cover It should be kept in view, that there is a why chlorine or oxymuriatic acid gas may not into which a tin or leaden tube is inserted, and a cellular oil in flax, which an alkaline ley desstroys; this is apparent from the harshness of timen yarn that has been boiled in it—the decomposition of this oil may be necessary to the composition of this oil may be necessary to the shelves in the tube or box, the tube is then composition of fine goods, but it is imparatus for steaming the flax be prepared from which the steam is generally with a weak solution of total or rendering it see and thinks have a solution of total or rendering it see and thinks have a solution of total or rendering it see and thinks have a solution of total or rendering it see and thinks have a solution of total or rendering it see and thinks have a solution of total or rendering it see and thinks have a solution of total or rendering it see and thinks have a solution of total or rendering it see and thinks have a solution of total or rendering it see and thinks have a solution of the see and the see and thinks have a solution of the see and water mixed with a weak solution of potash or rendering it soft and pliable, but as a preservatey from the leach tub, a fire is put under the boiler late in the afternoon, it boils during the evening and is left simmering till morning, when the clothes are taken out; and they must have been very foul to require any more labour fully applied as a solvent to the raw stem of them when the contact with mixtures of them, with such other bodies in the above forms, as do not impede or have been very foul to require any more labour fully applied as a solvent to the raw stem of them their attraction for the acid. It has been them when the contact with mixtures of them, with such other bodies in the above forms, as do not impede or have been very foul to require any more labour. than rinsing once or twice to make them perfectly clean. Now this process is managed by common house maids! What is to prevent them, cheap. A formula I met with some yeas ago, the wives and daugh ters of farmers and even farmers themselves from attending to a similar process on a large scale? I apprehend no dangel for the receiver; into the dispersion of the raw stem of hinder their attraction for the acid. It has been found that the oxygenated muriates of lime, and of the earths mentioned above, thus formed, when mixed with water, possess the power of removing colour from linen, cotton, and various other vegetable and animal substances, and have process on a large scale? I apprehend no dangellons of water in the receiver; into the dispersion of the earths mentioned above, thus formed, when mixed with water, possess the power of removing colour from linen, cotton, and various process on a large scale? I apprehend no dangellons of water in the receiver; into the dispersion of the earths mentioned above, thus formed, when mixed with water, possess the power of removing colour from linen, cotton, and various process on a large scale? > With respectful and sincere attachment, I remain, sir, your obd't serv't, S. W. POMEROY.

Extract of a letter from J. F. Dana, Professor of Chemistry in Dartmouth College, to the Editor, dated, Sept. 17, 1822.

DEAR SIR, I was pleased with the correspondence between Gov. Wolcott and Mr. Pomeroy, contain-

why chlorine or oxymuriatic acid gas may not

ger from steam, in fixing any stain or colour that may be communicated by the plant.

We will not inquire for a menstruum within the reach of "common farmers," and it will not be necessary for the present object to combine the bleaching process, though it may follow in a considerable degree. I would here observe that there was an important omission in copying my Essay for the press, in quoting of the application of birch ashes spread between he layers of flax before the salt water was turnted on for boiling. Should such a process be found beneficial, sea water can be easily and sheaply imitated in the interior country.

Mr. Dey asserts that the materials he has discovered for cleaning and bleaching flax dress-

nav of a

the leaden vessel which it contains and which is surrounded by water, will be also heated; steam, and chlorine gas will be formed at the same time; the former will dissolve the glutinous matter, and the latter will destroy the colour, and both will pervade every part of the apparatus. Experiment alone must decide whether this suggestion is practically useful; nor do I know that it has not been tried, and found

The muriate of lime, suggested by Mr. P. has no powers in bleaching, and it is stated by some writers, that it very much weakens the texture of linen.

J. F. DANA.

FLAX.

flax. Its whole cost, including the patent right, is only forty dollars. It has been tried by many of the most respectable farmers.

They estimate the saving in labour at three fourths, and the saving in flax at one fifth, company with the company mode, while it learned with the company mode.

This improvement promises to be extensively useful—its price is so small that every neighbourhood may easily have a machine. Flax is an article of easy cultivation and great product, if the process of rotting and usual way of cleaning it can be dispensed with, and must become an important staple to the people of the interior for home use, and transport to the seaboard, &c. A pound of flax may be carried any given distance as readily as a pound of corn, pork, &c. The cost of transportation will be the same; but the amount of that cost as to the relative value of the article, will be essentially different. The seed too, if crushed and into oil, will always find a ready market, and insome instances entirely dried from, the farmers find it difficult to procure sufficient water for their cattle. Notwithstanding the estimating their value, and willing to communicate the same to the community at large?* By adopting this measure, and insome instances entirely dried willing to communicate the same to the community at large?* By adopting this measure, and instances into oil, will always find a ready market, and better pay charges for corriegs then contained as prints of investigation of the obtained a spirit of investigation. and better pay charges for carriage than any sort of provisions that our farmers can raise in dant, in any part of our country west of the mountains.

flaxen goods—publickly, because it will add much to the national prosperity; privately, because we cannot have good paper without flaxen rags to make it of.

Niles' Register.

From the London Monthly Magazine of February, 1822.

WHEEL CARRIAGES. A patent has been granted in England to a Mr. Marsh for improvements on wheel carriages.

These improvements may be considered as of two parts: first, the form of the interior of the nave-box of the wheel, and, second, by the mode of attaching the pannels of the carriage to the frame work.

The patentee proposes to make the interior of the box triangular, square, or polygonal, instead of cylindrical, as heretofore.

ter articles were taken to New Orleans, where taken to New Orleans, where they found so good a market, that it is probasual, he proposes to leave them open, or in ribs, and to close the space with shutters, doors, or flaps, with rebates on their edges; and these flaps or shutters are attached to the frame work on hinges, so as to be enabled to swing. The external joints of the rebates are covered by slips of metal screwed down, which may be displayed. Another machine has been invented by Samuel Davidson, of Romulus, N. Y. for dressing when required. The improvements are pro-

An improvement in the construction of the pared with the common mode; while it leaves of cutting the perch and wings across the grain the texture of the thread unbroken. By the use of straight wood, in a curved form. In some carriages he makes the seat fold up into boxes by dispensed with, as it will answer for dressing the parts with hinges of metal or leather with or without rotting.

I have long desired that the knowledge of the natural resources of our country, should be more extensively and universally diffused, and considering your paper as an important channel, through the flax either with or without rotting. ther; and proposes to attach these folding seats which information and suggestions, that have a to carriages as additions, concealed by folding to-tendency to advance this important object, may gether into shallow boxes.

FROM THE BOSTON PATRIOT.

THE SEASON .- Boston.

We are informed that rain was never more heartily desired, or more needed, by our country brethren, than at the present moment. the excessive drought, however, it is expected there will be no serious deficiency in the crops small expense, and would yield large profits to their owners, if the supply of seed were abundant in any part of apples there is a part of trees were never, to our recollection, so generally overloaded; and, since water is so scarce, We feel both publically and personally interwe may reasonably expect that the cider that
ested in the cultivation of flax and the use of
is now making, will be of an unadulterated kind; In fact, we were informed, by a farmer, a day or two since, whom we saw attending a cider mill, and asked what quantity of water he should put into each barrel, that he could better spare three buckets of the pure liquor than one of water! We may therefore expect that good cider will be brought into our market, in large quantities, and afforded at a reasonable informed when price..

FROM THE ALEXANDRIA HERALD.

Wanboro, Illinois, July 9, 1822.

"Sir—In reply to your favour of May 2nd, I cannot give you much encouragement either as a schoolmaster, or a surveyor. Both those departments are fully occupied. As a cultivation of the land, there is room plenty; but without capital, it is a laborious occupation; and with capital, unless great industry and some merous intelligent Agriculturists, in all parts of the Union, he has rendered great service to the cause, by the distribution of seeds, grain, Ic. Ic. Ic. In parcels, of only half an ounce, the limit of his franking privilege. Yet Congress so far from extending, at the last session threatened to destroy even this limited power of doing service to agriculture.

The Editor will take an opportunity.

rated, introduce a convenient vessel of sheet lead which shall contain the materials from which chlorine gas is produced, viz. sulphuric acid, maganese and common salt. Now when heat is applied to the boiler to produce steam, present cylindrical boxes, where the axle and your own qualifications as to purse or manual the least are the leader wester which it contains and which have a sulphurical produce steam. present cylindrical boxes, where the axle and your own qualifications as to purse or m anual box are nearly in contact with each other all round. resource in the former, you must depend wholly on the latter. Land may be purchased in plenty at the government price of \$1 25 cents per gles of the box with blunted or rounded corners; or to use cylindrical boxes with longitudinal ribs, to reduce the surface of the contact, and leave interstices for the reception of the grease, or other matter used to reduce the friction.

To this improvement in the construction of the carriage body, instead of boarding the roof or the found so good a market, that it is proba-

Wishing you success, I am yours, &c.
M. BERKBECK.**

TO THE EDITOR OF THE AMERICAN FARMER ..

SIR, Moorefield, September, 1822. I have long desired that the knowledge of the be communicated to the public, I have resolved to make it the means of conveying to it the following observations and facts. Would it not be a politic measure for Congress, to enact a law rendering it obligatory upon the mail carriers to convey specimens of earths, ores, or vegetable substances from the mountainous and unfrequented parts of our extensive country, to the more populous cities, where there are scientific gentlemen who are capable of estimating their value, and cited among those, who on account of their own incapacity, and the impossibility of obtaining others to gratify their curiosity, now remain en-tirely indifferent and inactive. And thus would the necessity be superceded of importing at an enormous expense a number of articles which we consider exoticks, but which are in reality the spontaneous growth of our soil. It is true that the enaction of this law might render the post-office establishments more subject to impositions, yet I apprehend it would be practicable to make a provision, limiting the quantity that should be received, so that it should not incommode the post-masters, or retard the expedition of the

The Woad seed you favoured me with, is well adapted in its nature to our soil, though I am not informed whether it is an useful ingredient in coloring in any other state than the greent. If so

The earliest mention of the juniper-tree will kind, will keep on fire a whole year. be found in the first book of Kings, about 906 years before the Christian era, when the prophet Elijah took refuge in the wilderness of Beersheba, to avoid the persecution of King Ahab. "He went a day's journey into the wilderness, and came and sat down under a juniper-tree: And as he lay and slept under a juni-per-tree, behold then an angel touched him, the leaves and the fruit, before they are ripe,

This fruit is now become almost necessary in and said unto him, Arise and eat."

The juniper is also a native of most of the cold mountainous parts of Europe. Gerard says, "The common juniper-tree grows, in some parts of Kent, unto the bigness and stature of a fair great tree." It is found growing wild in considerable quantities on many parts of the Sussex and Surrey hills, from whence it is often brook, chap. iii., where he says, speaking of the collection and carminative, warming the collection and the citron-tree are natives of luxury in a variety of snapes; it makes an excellent sweetmeat when cleared of it's pulp, and prepared with clarified syrup. LOVE-APPLE.—SOLANUM:

OR, TOMATO-BERRY.

In Botany, a Genus of the Pentandria Monogynia Class. Natural Order, Lurida.

The love-apple, or tomato, is the fruit of the lycopersion, an herbaceous branching plant, or vine, with a hairy stem, and a rank smell.

It is a native of South America, and in all pro-

bability of Mexico; from whence it appears to have been brought by the Spaniards, who, as Barham observes, use them in their sauces and gravies; because the juice, as they say, is as good as any gravy, and so by its richness warms the blood.

Dodoens, in his Pemptades, published at Antwerp, in 1583, describes it as growing at that time in the continental gardens, and says, that

Parkinson, whose works were published in 1656, mentions it as being cultivated in England for ornament and curiosity only. Even at the present time they are grown in many gardens in the country, merely for the singularity of their appearance, varying very much in size and shape as well as colour; some being of a bright yellow, tus Kewensis, to have been cultivated in England as early as the year 1596; but I conclude it was introduced several years previous to that date, as Gerard mentions it in the early part of his voluminous work, as growing in his garden. This author callsit homum amoris; and says, "apples of love do growe in Spaine, Italie, and such hot countries, from whence myself have received seedes for my garden, where they do increase and prosper."
"There hath happened unto my handes ano-

but loses that quality as it grows older.

The juice, or decoction of the leaves, is carminative, and eases the colic pain. The inward bark destroys worms. Between the principal published in 1597, must have taken some years

The Portuguese call this fruit tomato, and eat

it either raw or stewed.

Lunan says of this fruit, "I have eaten five or six raw at a time : they are full of a pulpy juice, pulp, and have something of a gravy taste. The uice is cooling, and very proper for defluxions of hot humours in the eyes, which may occasion a glaucoma, if not prevented: they are also good in the St. Anthony's fire, and all inflammations; and a cataplasm of them is very proper for burns."

last few years it has come into great use with all our best cooks, as it possesses in itself an agreeable acid, a very unusual quality in ripe vegetables and which makes it quite distinct from all garden vegetables that are used for culinary purposes in this country. It makes a good pickle, and is preserved in various ways for the winter use, and is made into a kind of ketchup also. When boiled in soups and sauces, it imparts an acid of a most agreeable flavour; it is also served at table boiled or roasted, and sometimes fried with eggs. Loveapples are now to be seen in great abundance at all our vegetable markets, but I do not find that they are used by the middle or lower classes of

Mr. Wilmot recommends them to be planted against a bank, as being more congenial to their not offend the most tender stomach, but may be been polluted by the farina of other species of nature than a wall. MEDLAR.-MESPILUS.

In Botany, a Genus of the Icosandria Pentagy nia Class.

This fruit was known to the ancients in Greece, as it is mentioned by one of their authors, Theophrastus, who wrote 300 years, B.C.; but it appears not to have been cultivated in Italy so early, as Pliny states that it was not known in Rome in Anthedon, the Setanian Medlar, which he de-

Gallicum, or Bastard French Medlar.

Some authors affirm it to have been originally a German fruit; but the name Anthedon was doubtless given to it from it's being brought from a city of that name in Greece, while the last is declared by this author to have been from France: the Setanian seems to have derived it's name from it's growing near the marshes of Setia. It appears also to have been indigenous to this country, as it is mentioned by all our early writers. Tusser calls the fruit Medlers or Meles. Gerard says, "The medlar-tree often-times grows in hedges among briars and brambles : being grafted on a white-thern, it prospers and produces fruit three times as large as those which duces fruit three times as large as those which are not grafted at all, and almost the size of small apples. We have," says he, "divers sorts of there are too many melons produced of no value by those who supply the market, who endeavourthem in our orchards." He mentions the by those who supply the market, who endeavourthem in our orchards. The mentions the boundary with leaves like the hawthorn, and the Dwarf, growing naturally upon the Alps, and hills of Narbonne and Verona.

The Dutch Medlar, which is much larger and finer flavoured than the common sort, is the only kind now in request for planting in the garden or orchard. This fruit cannot be eaten when fresh gathered, being too harsh for the palate; but after it has been laid up for a few weeks, and un-dergone a putrefactive fermentation, it becomes quite soft, and is an agreeable fruit for the des-

serts in November and December.

This fruit is cooling, drying, and binding, especially before it is ripe, and is useful in all kinds of fluxes. The lapilli, or hard seeds, are accounted good for the stone and gravel; they are an ingredient in the syrupus myrtinus. (Miller's Bot. Off.)

The medlar-tree is propagated by budding or rafting on the hawthorn, as has been noticed by

Phillips:

Men have gather'd from the hawthorn's branch Large medlars, imitating regal crowns.

It is sometimes grafted on the pear stock, but is more productive by the former mode.

The pruner must observe not to shorten any of the branches, as the fruit is always produced at the extremities of the boughs.

MELON.-MELO.-CUCUMIS.

In Botany, a Genus of the Monæcia Sygenesia Class. Natural Order, Cucurbitaceæ.

being more fit for the dunghill than the table. In tention and expense to rear it, therefore Grugde not, ye rich, (since luxury must have His dainties, and the world's more numerous half Lives by contriving delicacies for you,) Grudge not the cost. Ye little know the cares, The vigilance, the labour, and the skill, That day and night are exercised, and hang Upon the ticklish balance of suspense, That ye may garnish your profuse regales With summer fruits brought forth by wintry suns:

Ten thousand dangers lie in wait to thwart The process.

Cowper.

No country has a greater variety of melons than England, yet it is so rare to find them good in the market, that the demand for them in London, compared to that in Paris, cannot be more than the proportion of one to a thousand.

I have observed, in other parts of this work that the French have particular places where they cultivate peculiar fruits only: this is the slave, having given a him a bitter melon, was case with melons, and where they are grown in such abundance as entirely to occupy the atten-tion of whole villages, the culture must necessation of whole villages, the culture must necessarily be better understood than in our gardens, where the same persons have to cultivate every The melon most esteemed, in every part of kind of fruit or vegetable: the mind being thus

sieves, which is about equal to 133 bushels, and the Mithridatic war, being one of the fruits ing melons in this country; that is, by planting that he then had many to spare. He adds, that the plants produced from twenty to forty pounds' says Miller, in that part of Armenia, which borwieght each, and that some of the apples measured twelve inches in circumference.

it; and, when, cut, the flesh should be dry, no The Musk Melon appears to be a native of water running out, only a little dew, which should Tartary, where it is found growing wild. It has lately been found in great abundance on the sandy plains in the neighbourhood of Jeypoor.—
This kind of melon has long been cultivated in taste, while in France it is chiefly served up at Italy, from whence I conclude it was brought to dinner, as a sauce for boiled meats. Miller says, Fingland, as it was first introduced into this "the seeds should not be sown before they are England, as it was first introduced into this country in the year that Henry the Eighth received the title of "Defender of the Faith," A. though we read, in the Philosophical Transactions, D. 1520: and from Gerard's account it appears of melons being raised from seeds that were forty-to have been nearly confined to the Royal Gar-three years old. Melon-seeds are cooling and Cato's days. Pliny mentions three kinds: the dens: he had not grown it himself, but says, diuretic: they are anodyne; and were formerly "They delight in hot regions, notwithstanding I used to take off stranguries occasioned by blis-

The water-melon, or cucurbita citullus, is a fruit greatly appreciated in Egypt, China, the East Indies, and other hot climates, where it is cultivated to a great extent on account of it's grateful coolness and delicious flavour; and the desh of it is so succulent, that it melts in the mouth and its central pulp is fluid, like the cocoa-Miller justly remarks, that, in this country, nut, and may be sucked, or poured out, through there are too many melons produced of no value a hole in the rind, which is a most refreshing

In some parts of Upper Egypt, whole districts are covered with water-melons. They are sown in the sand, on the banks of rivers; and it is in warmer countries, the melon is raised with little this situation, where the burning heat co-per-or no trouble, and the fruit attains a peculiar fine ates with the freshness of the water, which mois-flavour; but in this climate it requires great attens the stalks, that this fruit acquires its agreea-ble pulp. The Egyptains esteem it equally wholesome and agreeable. Sonnini says, their own melons are not so good as those grown in Eu-

The water-melon is allowed to be eaten in fevers and inflammatory complaints. One kind of the water-melon is pickled like gherkins, and much used by the French cooks in their fricassees; and they are sometimes baked in sweet wine. Gerard mentions, that the surgeons who belonged to the fleet, brought home many kinds of melons and pompions from the shores of the Mediterranean sea; but they could not have been ripened well in this country, before glasses were used for that purpose; and Parkinson seems to have been the earliest English author, who gives directions for making hot beds for melons, and covering them with bell glasses, which was in 1629.

Madame de Genlis relates, that, "the master of Lockman, the famous fabulist, who was a astonished to see him eat the whole of it; and, said Lockman, 'that it cannot be strange that I should have eaten without complaint the first bitter fruit which you ever presented me with.'— This answer so affected his master, that he gave

sult of mere theory but of actual experience,

to cultivate.

I remain, Sir, Respectfully your's ROBERT PITTER.

FROM THE VIRGINIA HERALD.

Fredericksburg, July 17, 1822. AGRICULTURAL SOCIETY.

An adjourned meeting of the Society was held t the Indian Queen Tavern, on the 4th instant. The subject of the Agricultural Fair alone occu-pied their attention. The following scheme is

the result.

We are gratified in seeing the proposition assuming this definite shape. The experience of all countries where these Fairs have been held, has demonstrated their good effects upon the agricultural character of the community. We believe also, that the one now under consideration, will benefit the business of this town. We therefore hope to see it respectably attended for the sake of both town and country.

To the Agriculturists of Virginia.

a portion of the powder of smut. After suffering them to remain together for 13 days, he ble correspondents, and particularly Sir John following scheme for an annual agricultural Show sowed one part of each, without subjecting it to Sinclair, in your Journal, giving various receipts and Fair at Fredericksburg, the members of the any preparation. The produce of the Lammas to prevent the Smut and Mildew in Wheat: Fredericksburg Agricultural Society, beg leave Fredericksburg Agricultural Society, beg leave most earnestly to invite their co-operation; in wheat, with the exception of one ear, is all yet, Sir, I venture to suggest, that if wheat were sown earlier, and clean dry old seed, we should hear little of Smut or Mildew. Of late years of the landed proprietors and cultivators throughout ol, for various periods of time, of from one regular summer fallows have gone out of hour to several hours. In the Lammas wheat, fashion, and green crops having been substitusteeped for one hour, there is one head of smut, ted, the wheat seed-time has been much proin all the others not one particle. I am thence tracted, besides, generally new and often damp lar institutions wherever they have been induced to rely, with (if possible) increased conseed has been sown: these I had often damp induced to rely, with (if possible) increased constant, seed has been sown; these, I have no doubt, blished, are so obviously great and extensive, that the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; these, I have no doubt, blished, are so obviously great and extensive, that the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; these, I have no doubt, blished, are so obviously great and extensive, that the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; these, I have no doubt, blished, are so obviously great and extensive, that the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; these, I have no doubt, blished, are so obviously great and extensive, that the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; these, I have no doubt, blished, are so obviously great and extensive, that the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; these, I have no doubt, blished, are so obviously great and extensive, that the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; the security given to the wheat crop are causes of Smut and Mildew, and hence has been sown; the security given to the security g it is this year so very prevalent in a field ad-invariably old dry wheat, sown before October, pride which checks effort by inspiring the fear of failure, as to make a beginning. It would be absurd to expect from a first attempt, that full crop is smut, and in most of the fields around rally been more or less affected with those rume there is more or less, and in all either milinous diseases. No two things, in my opinion, well matured by frequent recurrence. Let us me there is more or less, and in all either mildew or red gum to a great extent. Of the mildew I have none, of the red gum so little, as
a proper summer fallow, and old seed sown
hot to be worth notice. It cannot be chance that
has thus secured us, whilst others are suffering
severely."

The following is the simplest mode of applying this important remedy:—After dissolving
five pounds weight of the sulphate of copper,
or blue vitriol, in hot water, add as much cold
water as may be sufficient to cover three bushels of wheat. Let the wheat be gradually
passed through a riddle, in order that all the
light grains may swim on the surface, and be
skimmed off. Stir the wheat repeatedly, that
it may be effectually cleared of all the light
grains. Let the wheat continue in the liquid

rupted retirement from the busy haunts of their mendation, and this to be ascertained by the Dyfellowmen. It is at such places as Agricultural nanometer. Shows and Fairs, that sales and purchases of stock, of all kinds—pleasure horses, working cattle, farming implements, crops, and merchandize, might be made to more advantage probabably than they could at any other time. And the general excitement to enterprise and improvement, in all the various branches of rural economy, produced by these public competitions for shortest time, and most economical mainler, or excellence in husbandry, cannot fail to exercise a most beneficent influence on the whole landed interest of our country. Without some such stimulus to the languid—and we may almost say torpid lust ot the languid—and we may almost say torpid lust of the sense width and line of the sense width and lin my, produced by these public competitions for excellence in husbandry, cannot fail to exercise a feelings of our agricultural people, we must continue, to the end of time, nearly a century behind our brethren of the north and east, in all those arts which contribute to embellish and adorn the fair face of our beloved country; and to render its soil productive of the necessaries, the comforts, and the luxuries of life.

The plan is as follows: nually be held at Fredericksburg, in the month of November; and that the first shall take place on the second Wednesday in November next, being the 13th day of the month. It shall continue for marks, felt much hesitation in publishing them, the 13th day of the month. It shall continue for marks the second wednesday in November next, being the 13th day of the month. It shall continue for marks, felt much hesitation in publishing them, and that it is surely the expectation of all those

um. By that report it is stated that,
"After a careful examination of the ploughs "in operation, tested by the dynanometer, the "Committee have come to the determination that the premium, should be awarded to Mr. "William Brown of Brookville, Montgomery 12th. \$20 for the best Beef—\$15 for the best "county, Maryland—in 32 minutes of time, Mr. eal—\$10 for the best Mutton, fattened in the "Brown's plough went over a space of ground " wide, carrying a furrow of the same width and " depth, and having a resistance of 528 pounds; "price of plough \$14. Mr. Davis' went over a "space of the 330 feet long, 19 feet, 6 inches "wide, carrying a furrow of the same depth and The following commentaries of Gideon Da-" breadth, in the same time, and having a re-

difference in the measurement of the perform-

The measurement was taken in three places, 15 paces from each end and midway; of which Brown only 15 feet 7 inches, instead of 21 feet 8 inches, that is 39 per cent more, than he actually ploughed. Hinks' land measured from out to out 16 feet 6 inches, and there was left in the middle still to plough 10 inches, which makes By a reference to the report of the Committee the quantity ploughed by Hinks 15 feet 8 inches peculiar propensity to fatten, and to produce a quantity of wool.

By a reference to the report of the Committee the quantity ploughed by Hinks 15 feet 8 inches on Agricultural Implements, Machines, &c. &c. at instead of 17 feet 3½ inches—the work done by my plough was 17 feet 4½ inches, instead of 19 the Cattle Show, No. 2, of Maryland, held on my plough was 17 feet 4½ inches, instead of 19

we shall find that Brown and Hinks ploughed 14 feet each, and that my plough turned 16 feet, that is about 121 per cent more. There is another subject that those who feel an interest in this matter should be made acquainted with; that is, that one of my horses was not in condition for such an experiment; he was in such condition, that he could not walk as fast as a plough horse should, until he had considerable exercise, in consequence of which, when Brown's and Hinks' teams had each ploughed 4 furrows, my team had ploughed 6 furrows more, my team had ploughed appeal to the great Agricultural Society of Mary-eight—so that I do really believe, that if my land whether I am not fairly entitled to the pre-team had been in proper condition, that my moffered for the best plough, at their last plough instead of performing only 111 per cent. cattle show and fair. more than Brown's plough, would have performed upwards of 20 per cent. more.

As it respects the draft, I believe that the dy-nanometer, or instrument by which that was tried, was not correct. Because, when it was first attached to my plough, the plough run between two and three inches too deep, and was a heavy men disinterested, and well qualified for such a peared to be very exact, and I believe they draft for the team; it was then said to weigh task, with whose measurements mine agree. 500 pounds. I then made considerable alteration in the geers, and set the plough at the proper depth about 6 inches, it was still said to weigh difference in the draft, I should think at least 50

If any should think this statement incorrect, by going on the ground, they may make measurements and satisfy themselves; let it be remem-quainted. bered, that after the expiration of 32 minutes, there was one furrow ploughed on the east side of Hinks' land to finish it, and that there was two furrows ploughed all the way down on the east Gideon Davis, side of Brown's land, and one chief part of the Dear Sir,—I a way, and one furrow on the west side all the way up, and that there still remains about 1 foot 9 inches in the middle to plough.

I dont know.

due, not only to myself and family; but to a large me to express their thanks to you.

Yours. &c. have had their attention turned towards my establishment, with an expectation, of there finding some improvements in Implements of hus-

description of the Brown's plough, for I have no doubt but that the expectations of many are raised considerably, and that they are looking out for something very superior. The Brown's plough is nothing more, nor less, than an old fashioned, (what in this part of the country is called a long) barshare plough, without any other improvement that I know of, except the cast-iron mould board instead of wood. It would be right

es—that is, that the operation of my plough, in to say, that this particular plough, had been fin-tance only that it was wished to determine) but he 32 minutes of time, was worth 11 5-10 per cent. ished off in a very nice manner; that the share is certainly mistaken, for I paid particular atmore than the operation of Brown's plough. By the report of the Committee it is stated, very sharp, and that the moulding part of the with confidence that the result reported by the that the ploughs each cut and turned 1 foot wide plough had been tallowed all over, how much adand 6 inches deep—Brown and Hinks' teams, vantage that might be, I cannot say, I have no ploughed each 14 furrows—my team ploughed doubt but it would be some. The committee in the depth or breadth of the furrow was intheir report go on and say. "Those were the only stantly made manifest by the index. To this " other ploughs were turned in however, more for the satisfaction of the owners, than for in-

ploughed only three; when their teams had thus; that in the operation my hlough exceeded by furrows, allowing a foot to each, is not corploughed 4 furrows more, that is, 8 furrows each, in all, my team had ploughed 8 furrows also; have been the best—that in the price my plough of the width I am unable to say, for the ground after that, my team gained, when they had each is \$1 less than the Brown's plough—Now I will be sould do to each, is not corplous the furrows, allowing a foot to each, is not corplous that is, 8 furrows also; have been the best—that in the price my plough of the width I am unable to say, for the ground was not measured by me. It was as much as

ploughs fairly in competition, and which came fully under the observation of the committee— particularly directed, and to the frequent measurement of the depth of the furrow during the time that the ploughs were in motion, to spection, and the performance in general was see that the ploughmen ran the proper depth. They were allowed to plough any width they with great neatness and expedition. It is due to Mr. Davis, to say, that his plough is plain and simple, and of course cheap, and from appearance, not liable to get out of order easily."

They were allowed to plough any width they pleased, provided they turned the sod fairly over, and it was only during the test of the draft by the instrument, that they were limited to a foot wide, and six inches deep; therefore Gideon Davis's estimate of the work done bus, that in the operation my though exceeded by furneys, allowing a foot to each is not conwas not measured by me. It was as much as I could do to attend to the draft and ploughing. Gideon Davis states, entrusted with the mea-surement, and the statement in the report was taken from their minutes. I observed that they appeared to be very particular, and I can know no reason for believing that they would have any motive for introducing into the re-port any thing not strictly correct. They ap-

If Gideon Davis's horses were not good, the Committee were surely not blamable on that account; and if any of the ploughs were in better order, or greased, or steel pointed, the Committee had no right to object thereto. relates to the subject with which thee was acses, and were bound to decide on such as chose quainted.

Pendleton County, (S. C.)

June 20th, 1822.

GIDEON DAVIS,

Dear Sir,—I am sorry that circumstances have been such as to oblige me to defer answering to enter the neld, be their condition what it might; and whether the winning plough was not a subject of inquiry, the actual performance was all they had to look to. It appeared to be the universal sentiment that the performance of Mr. Brown's plough was very far superior of any other on the field, and I then thought, and still think that the premium was fairly think. see how Gideon Davis can charge our Com-mittee with unfairness or claim for his plough the premium with more propriety than he could claim the premium at Brookville, or reflect ty Society. In conclusion I must say that I believe Gideon Davis's a very fine plough, and from the explanations he gave me as to his manner of making them in stocks, I think it likely there would be great uniformity in all of them. What one would perform, I think it likely all would perform, and whether this is the case with all the ploughs of Mr. Brown's make, or bandry, that might tend to their advantage.

In order to satisfy the enquiry of the thousands who have read that report, and will read this exposition, I think it right for me to give a and I have given as much attention to the padescription of the Brown's plough, for I have no per of Gideon Davis which it inclosed, as my his plough also I should think in the long that the the expectations of many are public duties would allow.

Meridian Hill, August 20th, 1822.
What one would perform, I think it likely all would perform, and whether this is the case with all the ploughs of Mr. Brown's make, or of the make of any of the others who exhibited ploughs on the occasion, I am unable to say—his plough also I should think in the long run would be a very cheap one, as there is very little wrought iron about it, and it would be seldom necessary to send it to the shop.

With great respect,

Your ob't serv't.

ASHLAND, 19th August, 1822.

Your letter under date the 11th ultimo, reached Lexington, whilst I was absent from home, on a visit to one of our watering places, and on that account there has arisen some delay in my answer. I received the portraits by mail, shortly after I addressed you on the subject of them.

You request some account of my imported Euglish Cattle, which I give with great pleasure. In 1816, I wrote to my friend, Peter Irving at Liverpool, the brother of our distinguished countryman, Washington Irving, and requested him to purchase for me two pair of English Cattle, one of the beef and the other of the milk breed. Agricultural books, and Societies, are now quite established in the minds of every reflecting person. And now may the field smile; the dreary places be clothed with fruitful verdure; or chards and gardens yield their various and abundant routine of fruits, roots, and vegetables, which it is desirable that cattle should possess. Accordingly he caused to be selected and purchased for me, in January 1817, two pair of that breed of cattle. Two of them were two yearids, and the other two yearlings; the sum of their cost was \$2105 sterning. They were shipped at Liverpool, in March 1817, no board the same ship, which imported the English Cattle, for some gentlemen in this neighbourhood, an account of which you have already published, but that was altogether accidental, there having been and me, in making our respective importations. They were received by Messrs. McDonald and the stable of the ment of the minds of every reflecting person. And now may the field smile; the dreary places be clothed with fruitful verdure; or chards and gardens yield their various and abundant routine of fruits, roots, and vegetables, than of the wild ambition of those who aim to cultivate the most thousands of corn hills, crop or no crop.

North Carolina labours under the disadvantage, of being more remote from intercourse and improvement, than her sister states. But too much praise cannot be given to the fair sex of this section of the Union, who are not only daily entire to be known. I will through the medium of your valuable paper, suggest a means by which societies, and individuals engaged in the farming interest may communicate with more advantage than has thierto ever been done. In the first place let every Agricultural Society immediately establish a nursery for the raising of the most valuable plants and seeds. Second-of the cultivation, be enabled to furnish green peas, aspansed, the mean of the things of a day may hereafter. and me, in making our respective importations. They were received by Messrs. McDonald and Ridgely, in April or May 1817, and I immediately establish a nursery for the raising of the most valuable plants and seeds. Secondly, put up all kinds of garden seeds in small parcels, folded up with printed directions respecting them about one hundred and fifty miles from Baltimore into the State of Virginia, and owing to the great heat of the season and the wearing away of their hoofs, he was obliged to leave them there to rest, until the weather became cooler; so that it was late in August before they reached Kentucky. One of the bulls died on his way from Baltimore to Virginia, from over they reached Kentucky. One of the bulls died on his way from Baltimore to Virginia, from over feeding on red clover. Estimating the first cost of the cattle, and all incidental charges from the time they were purchased in England, until the cattle, and all incidental charges from the time they were purchased in England, until I received them in Kentucky, and charging the three survivors with what was lost by the death of their companion, those three have come to me at five hundred dollars each. My cattle are very beautiful, fine form, symmetry and color.—

They are all without exception, a deep red, white faces, white under the belly, at the tip end of the tail and on one or more of the feet. As I have generally parted with the young, I am not able yet to pronounce, with certainty, whether they will versa. As buds and grafts might thus have a line of the feet out, lined inside with small drawton in the seed, &c. The brims at bottom might on their top contain a matrass. A portable stove also, for damp weather, might be very useful. Such vehicles under the care of two steady men; might repair and almost counteract all the ills that ever escaped Pandoras' box. One of these men should be well acquainted with budding, grafting, &c. Thus might we were soon have many of the northern fruits ingenerally parted with the young, I am not able yet troduced into the southern climes; and vice two very pleasing communications were inserted to pronounce, with certainty, whether they will versa. As buds and grafts might thus have a line of the fitted out, lined inside with small drawton in the seed, &c. The brims at bottom might on their top contain a matrass. JOHN S. SKINNER, Esq.

FOR THE AMERICAN FARMER.

ENGLISH METHOD OF CURING BACON, MR. SKINNER, About twelve months ago, or perhaps more, troduced into the southern climes; and vice two very pleasing communications were inserted in your highly valued paper, teaching us how to pronounce, with certainty, whether they will versa. As buds and grafts might thus have a in your highly valued paper, teaching us how realize the high expectations, which were enter-tained of them by my friend, Mr. Irving; but I might also be furnished with the most useful lot to take charge of that very interesting

which we have made. The latter do not, however, superiour court; and it is more than probable, cause to regret that their kind host had admin-want size, and the circumstance of their being that a load of seeds might be disposed of in istered any other than his own favourite pre-

With great respect,

A PLAN FOR THE DISSEMINATION OF AGRICULTURAL KNOWLEDGE— SEEDS, IMPLEMENTS, &c.

Perquimino, N. C. August, 1822. SIR. The utility, and great benefit derived from

ENGLISH CATTLE—account of Mr. Clay's better, so as to produce more meat on the good importation—communicated at the request of parts. Animals which are ill made, are difficult the Editor, to be made matter of record, in the to keep in good order, because they cannot there is not a gentleman or liberal farmer, but American Farmer. well built. I may, at some future period, inform fully give 100 per cent advance, on first rate you how my cattle turn out. House, where he could have occular demonstration of the great benefit to be derived from such an intercourse while each would be anxious to send back some of their superfluities to increase the general stock. This would give men the greatest taste for agricultural improvements, and tend much to the raising and increasing of Agricultural Societies. Numbers who are too remote to attend, might join themselves to some society by subscription; and thus lay the foundation for improvement in the union and means that such societies would then have. Indeed the wealth, prosperity, and comfort, of eve-I gave him a carte blanche, both as to price and Agricultural books, and Societies, are now quite and a great pains to satisfy himself of established in the minds of every reflecting perturbation. And now may the field smile; the dreary of agriculture thoroughly understood, and more

believe he has not been deceived as to their qua-lities. agricultural books, prints of small light models branch of domestic economy, (for as yet I am only a consumer) the information therein We have been for some years breeding in this state, very extensively, from some English Cattle, imported forty or forty-five years ago, by, I allow them a small premium for orders thus rebelieve, Mr. Gough, of Maryland, and Mr. Miller Virginia. This race of cattle attains a larger size, than any of those of the late importations of the second and the strictly adhered to the nearest scaport in trading vessels. The late importations therein am only a consumer) the information therein contained will be attentively perused, and so far manufactures, or patentees; as they also could as the receipts of the adepts are not inconsistent, will be strictly adhered to. They are both, no doubt, the result of experience, and whoever should be doomed to discuss which we have made. The late and only a consumer) the information therein contained will be attentively perused, and so far as the receipts of the adepts are not inconsistent, will be strictly adhered to. They are both, no doubt, the result of experience, and whoever should be doomed to discuss whoever should be doomed to discuss the receipts of the adepts are not inconsistent, will be strictly adhered to. They are both, no doubt, the result of experience, and whoever should be doomed to discuss the receipts of the adepts are not inconsistent, will be strictly adhered to. They are smaller than the descendants of the old importa-tion is abundantly compensated by their having less bone, being greatly superior in symmetry, and distributing their flesh on the carcase much

system, as is now to be found through the country in support of the "hockside," and its opposite—or in other words the Maryland and Virginia side. Every man of reflection, and who looks deep (more especially if he should belong to that very knowing and respectable family, the Croakers,) must see that this is bringing about a "bone" of contention which is one day or other to set these two sister states by the ears—as the Missouri question, has recently done with more of the same happy family. To be Hockites and anti-hockites will one day (no doubt distant) be the badge of distinction like the White and Red Rose of York and Lancaster. Pardon this digression, and return to the subject—whilst we have been instructed and pleased by the communications from both the gened by the communications from both the gen-been first tasted by tlemen, it was thought that it would not be otherwise than appropriate to detail a conversation with August 28th, 1822. an English dealer (to use his own phrase) in pigs, a native of Hampshire now resident in Bal-timore, who states that the part of England from whence he came was above all other parts distinguished for the curing of bacon, and that distinguished for the curing of bacon, and that voured with a translation of some remarks on the process by which this excellence was eften the Raising of Silk Worms, grounded upon the raised in this country, as well as cotton, and experiments of the writer. of taking it off by scalding, in the way that we are accustomed to pursue, and that so much the more was the singed bacon esteemed, that was about three years since, that cleansed by an the nourishment the Silk Worm requires. scalding, commanded 78 shillings, and the singled 84 shillings the hundred. He represented the mode of cleaning to be very simple. The attention to raising silk works at their own the mode of cleaning to be very simple. The killed, place it upon the ground or a board, cover it over with straw and set it on fire, and
after burning the hair quite off, at the same
time taking especial care not to burn the skin,
it should then be hung up and swept clean,
and scraped gently, so as to avoid breaking
the skin; after it has been washed down, it is
to be opened and cleansed within, &c. My
narrator stated another peculiarity of no great
consequence, and not having it is believed any
effect upon the quality of the article in question; yet as at variance with our mode it is
mentioned. The Hampshire practice is to cure
the shoulder, middling and gammon; united in
this form there would necessarily be less rust a reason shewing why this singing operation should improve the bacon. Yet as it was stated to me as a received fact, and that there must be the difference the price denotes, I thought it would not be foreign from the object of your paper to throw it to the public, that the knowing ones, and the curious, if they thought proper might amuse themselves with he could keep with the small quantity of multiplication of the south, wainscoated, culiarity in the curing of English hams is reclosed with ten windows, and Chinese blinds of the north house, where there had been no fire. Many of your Eastern friends were at the Show. Mr. Parsons' stock, Holderness, obtained window, in order to ascertain whether they would hatch by the simple action of the atmosphere. Many of your Eastern friends were at the Show. Mr. Parsons' stock, Holderness, obtained the first premium. You are confidently expected at the Brighton Show, and Capt. Winship tells me, from the entries already made, that there will be a good exhibition. I hope you will find it convenient to attend.

POMARIUM BRITANNICUM,

An Historical and Botanical account of Fruits, known in Great Britain, by Henry Philips, -Second Edition.

(Continued from page 218.)

MULBERRY.-MORUS.

In Botany, a Genus of the Monacia Tetandria Class.

That the mulberry-tree is a native of other upon the Philistines, and smote them over against the mulberry-trees. Again, in the Psalms, we read, "He destroyed their vines with hailstones, and their mulberry-trees with frost."

This fruit was first brought from Persia into Greece and Rome, and was more esteemed by the Romans, even in their most luxuri ous days, than any other fruit.

Ovid has celebrated this tree in his story of Pyramus and Thisbe:-

The berries, stain'd with blood, began to show A dark complexion, and forgot their snow; While, fatten'd with a flowing gore, the root Was doom'd for ever to a purple fruit. The pray'r which, dying, Thisbe had preferr'd, Both gods and parents with compassion heard: The whiteness of the mulberry soon fled, And, rip'ning, sadden'd in a dusky red.

Pliny observes (book xv. c. 24,) that "there is no other tree that was so neglected by the wit of man, either by grafting, or in giving it names, except that of making the fruit large and fair." "At Rome," he continues, "we make a difference between the mulberries of Ostia and those of Tusculum." This author observes, in his xvith book c. 25, that, "of all the cultivated trees, the mulberry is the last that buds, and which it never does until the to put forth buds, it dispatches the business in their breaking forth may be evidently heard."

by the Romans, particularly for the diseases of fruit, mixed with cider, is esteemed the best of the mouth, the windpipe, the uvula, and the stomach. The leaves and the roots were also Miller mentions eight varieties of this agree-

it is said that it was first planted at Sion House, where the original trees still thrive, and which I have seen since the first part of this work has been put to press. The interior of these trees trained to a trellis, upon a south wall. Heliogabalus was the first Roman that wore trees is so entirely decayed, that the timber has These trees are about 16 feet high, and the a garment all silk, which must have been about crumble in the hand; yet its branches, that are supported by props, are so well nourished by means of the bark, that the fruit and the foliage appear as luxuriant as those of the youngest trees: a strong proof of the durability of the mulberry-tree in this country. The first Duke of Northumberland said he could trace these until October. They are pruned twice a year, Corinth, &c. trees back three centuries.

until it has arrived at a considerable age, has ted. Since this time the olive-branch has been land in the year 1570; but there is little inbeen much against it's cultivation; but it is used as an emblem of peace by all civilized na-ducement for us to cultivate it, since it is by no now discovered, that by grafting it from the tions; and it is observed that a green bough anaged trees, or, to use a common phrase, putting swers the same purpose amongst the most savage ripe fruit. Besides, the climate in general is an old head on young shoulders, it soon becomes people in every part of the world.

NECTARINE.—AMYGDALUS, MUC-PERSCEA.

In Botany, a Genus of the Icosandria Monogynia Class.

drunk by the heathen gods.

It is a native of Persia, and was brought into David also seems to have considered the sixty miles from the sea, he states, this country, with the peach, about the year olive as a blessing when he says, "Thy children an oak has stood it cannot be raised. 1524. It does not appear at that time to have like the olive-branches round about thy table: rard was living when it was first obtained, and The Grecians appear to have thought no less Lent eat in its ripe state, without any published his History of Plants about thirty-five of this tree and it's fruit than the Israelites. In tion, but a little pepper, or salt and oil gardens and vineyasds: I have them all in my between Neptune and Minerva, arising from the desire of each of them to since the desire of each of them to since the sin which shows there was a variety when first introduced. He mentions one kind of peach which appears to have been the Nectarine, Persica rubra. "The fruit of peaches," says Gerard, of this sort, be round, of a red colour on the of this sort, be round, of a red colour on the but Minerva, by causing an olive-tree to spring outside: the meat likewise about the stone is of from the earth, gained her point, and from her a gallant red colour. These kinds of peaches was the city called Athenæ, now Athens, since a gallant red colour. These kinds of peaches are very like to wine in taste, and therefore marvellous pleasant.'

Pliny says, of all the peaches, the one most admired in Rome is that named Duracina, from the solid substance of the meat; which seems branches. to agree with the quality of the nectarine, the principal distinction of which, from other peach-

pulp, it's superiour flavour, and smooth skin.

There have been many instances of nectarines having grown not only on peach-trees, but on branches bearing both beaches and nec-

wore silk mantles at a ball given at Kenilworth I have not yet been able to ascertain, although Castle, in Warwickshire, in 1286; and it was this circumstance has occurred in the gardens clude, from several passages in Scripture, that worn by the English clergy in 1554.

Thompson has beautifully distinguished it from the common peach in his Seasons:—

As I steal along the sunny wall,
Where autumn basks with fruit empurpled deep. My pleasing theme continual prompts my thought; Presents the downy peach, the shining plum,

In Botany, a Genus of the Diandria Monogy nia Class.

turned with an olive leaf in it's mouth, by which believes they were much more numerous. The mulberry-tree's seldom producing fruit he knew that the waters of the Deluge had aba-

That the olive-tree was anciently very much esteemed by the Hebrews, is proved by the pa-

rable of Jotham :-

"The trees went forth on a time to anoint a king over them; and they said to the olive-tree, Reign thou over us. But the olive-tree said un-to them, Should I leave my fatness, wherewith best in dry hills that are full of white clay; for This fruit is thought to have derived it's by me they honour God and man, and go to be in moist and fat fields it produces plenty of name from Nectar, a beverage supposed to be promoted over other trees?"—Judges, chap. ix. leaves, but no fruit. Though this author converse 7.

years later, wherein he describes four kinds of their fabulous histories, we are informed, that peaches, and says, "they are set and planted in the gods having been called on to settle a dispute city of Cecrops; they determined to give the preference to the one who should produce the most beneficial gift to mankind. Neptune, stri-king the ground with his trident, created a horse; the olive, the emblem of peace or agriculture, was much preferable to the horse, the symbol of war and bloodshed. Minerva and the Graces are also represented as crowned with olive-

Grecians who attended the Panathenan, a fes. profitable article of commerce, but forms a princonsists in the firmness and fineness of it's superiour flavour, and smooth skin.

There have been many instances of nectations this festival, were crowned with a wreath of interesting grown not only on peach-trees, at on branches bearing both beaches and nectations, without either budding or grafting: walks, belonging to a man of that name. Plato olives are first bruised by a mill-stone, and afterwards put into the trough of a press for the tarines, without either budding or grafting: walks, belonging to a man of that name. Plato olives are first bruised by a mill-stone, and afwhether this is owing to it's being so nearly alhaving here opened a school of philosophy, all
lied to the peach, or by the pollen of the necplaces of learning have been since called Acapurpose, which, by means of turning a strong
tarine being conveyed by the bees or the wind, demies.

As to the soil of the olive-tree, we may con-Stockings made of silk were first worn by Henry the Second, of France, in 1543; and in 1549 mulberry-trees were propagated through all France; and the breeding of silk-worms was large through the second, of Servius Tullis, the Landesborough, Yorkshire. sixth king of Rome; and in that very year was Nebuchadnezzar restored to his understanding and his kingdom, after having spent seven years among the beasts of the field.

The olive seems to have been highly appreciated by the Romans; as Pliny says, "except the vine, there is not a tree bearing fruit of so come into use, and it is now so common in this country, that it would be difficult to find a female servant in the streets of London, or any part of the kingdom, who had not some portion of her dress composed of silk.

The ruddy, fragrant nectarine; and, dark Beneath his ample leaf, the luscious fig.

The flowers have an aromatic bitter taste, and, when fresh, an infusion of half an ounce in water, or a drachm, when dry and sweetened no olive-trees either in Italy. Some art of the kingdom, who had not some portion and, when fresh, an infusion of half an ounce in year from the foundation of Rome, there were water, or a drachm, when dry and sweetened water, or a drachm, when dry and sweetened with sugar, is a useful laxative for children.

The alba, or white mulberry, is a native of hina.

The nigra, or black mulberry, is the tree of a largest size, and the fruit is of a blackish od colour, and from it a good wine is made:

OLIVE.—OLEA.

OLIVE.—OLEA.

The Rotanus of the Diandria Monoguhis time, they were to be found in the very heart of Spain and France, but that the olives Virginia.

Of this tree we have very ancient mention, of Syria, although smaller, produced the best since it is related, in the Book of Genesis, that oil. Virgil mentions but three kinds of olives: the dove which Noah sent out of the ark, re-Columella mentions ten varieties, but says he

The olive-tree was first introduced into Engmeans handsome, and we have no desire for its though I have no doubt but it would flourish in many situations on the south side of the Sussex Downs, where the fig-tree thrives: indeed, in some parts of Devonshire it is found as a standard tree, and is seldom injured by the frost.

tradicts the idea that the olive will not grow sixty miles from the sea, he states, that where

The olive-tree requires but little care in the been distinguished by any name distinct from other peaches of which it is a species, as Ge-the Lot thus shall the man be blessed that feareth the cultivation, and produces fruit but once in two other peaches of which it is a species, as Ge-the Lord." years. This fruit the modern Greeks during ent eat in its ripe state, without any prepara-

> We receive it from the south of France, from Spain, and Portugal, pickled in the following manner: it is gathered unripe, and suffered to steep in water some days, and afterwards put into a ley of water and barilla, or kali, with the ashes of olive-stones calcined, or with lime. It is then bottled or barrelled with salt and water, and in this state do we meet with it at the desserts of our most wealthy tables, where fashion has done much in having introduced and given a fondness for olives, which seems to be an acquired taste: however, they are grateful to the stomach, and are considered good to promote digestion and appetite.

But olives are chiefly cultivated for the sake A contribution of olives was given by all the of the oil that they produce, which is not only a

virgin oil. A coarser kind is obtained afterwards, by adding hot water to the bruised fruit.

The oil of olive seems to have been of great utility to the ancients, since Aristaus, son of Apollo by Cyrene, was regarded as a rural deity for having taught mankind to extract it, and also to make honey, cheese, and butter. The wrestlers were anointed with it; and it was made a substitute for butter, which among the Romans was used as a medicine.

We find, in the book of Leviticus, that oil formed a principal part of the meat offerings, meat offering, baken in the frying pan, it shall be made of fine flour with oil."

Pliny informs us, that in the 500th year of the city, when Appius Claudius and L. Junius were against the cold.

The best olive-oil at present is obtained from

Provence.

The wood of the olive-tree is used by cabinetmakers, from it's being beautifully veined, and

admitting an excellent polish.

Selections from late numbers of the London Farmer's Journal, received at the office of the American Farmer.

rience, have been since confirmed by that test of truth. The first we meet with is this:—

" OF THE EYE-PITS."

"The eye-pits should not be too much sunk, for if they are deep and hollow, they are ugly, and make the horse appear to be old. Horses that come out of an old stallion, have it from their very youth, some more, some less.'

" OF THE EYE."

" If you can perceive above the bottom, or apple, of the eye, as it were, two grains of chimney soot fixed to it, it is a sign the chrystal is clear and you can,"—meaning, according to the nature of chiefly from practical men; and I like to reduce transparent; and if to this, the bottom of the eye the labour. "Those who think it frugality to knowledge to maxims. Your's, &c.

scribed the usual marks by the mouth] is when a quick, as some people do, who think thereby to horse seeleth; that is, when upon his eyebrows prevent the so frequent shoeing of their horses. horse seeleth; that is, when upon his eyebrows prevent the so frequent shoeing of their horses. about the breadth of a farthing of white hairs, The foot pared, you must fit the shoe to it, which mixed with those of his natural colour. A horse never seeleth until he be 14 years old, and always before 15 or 16, at farthest. Horse-coursers [dealers] commonly pull out those white hairs than the heel [by the spunge, he means the end, with pincers; but if there be so many that it cannot be done without making the horse look bald

they may not appear old." More than half the author), that a man should never buy a horse which is both light-bodied and fiery, because such horses destroy themselves in an instant. Many people do ignorantly confound fieryness with rigour, or high mettle; whereas, true mettle doth not consist in fretting, or trampling, dancing, and so forth, but in being very sensible of the spur. profitable management of that most valuable aniformed a principal part of the meat offerings, which the Israelites presented to the Lord: Not but that fiery horses are many times might make the interpretation of a meat offering baken in the oven, it shall be unleavened cakes fretful disposition." Again: "A horse low in spring food, they may be bred and nourished to case, cannot be made plump unless he eat much the greatest profit, and I believe that to be strictly the case. But on extensive grass farms, I wish makes his helly like that of a cow with hay, which makes his belly like that of a cow with calf." This puts us in mind of the hay and water for information, whether that sort of stock may system at livery stables, mentioned by Taplin, who remarks very truly, that a horse which has eaten much hay is not fit to travel or labour, because is, that it may, and for this obvious reason: turconsuls together, a pound of oil was sold for the stomach being too much filled, presses on the twelve ases; but that in the year 680, ten pounds of oil sold for one as, and that, in twenty-two that horses which are kept on straw, or poor food, years after that time, Italy was able to furnish the provinces with oil; and it was much used the nutriment, that they are not fit for business, and yet flocks equally large were maintained in the strain of the strain o at their baths, having, as they supposed, the nor can be put to labour without danger to their those times, as in the present, and certainly to property of warming the body, and defending it wind; nor to any profit, they are so sluggish and profit, or they had been abandoned for stock of a

with fatigue.

" How to know if a Horse have a good appetite, or be subject to the TICK.

" If a horse be light-bellied, it were convenient he has a good appetite. Take notice, while he is eating his oats, if he be not subject to the tick, ed from the French of the Sieur DE Solleysel. his throat, whereby he loses part of his oats.

" Of the art of shoeing," the Sieur's observa-tions are generally rational and useful: there are four rules, he says, to be observed. The first is, "Toe before, and quarter behind,"—by which he means that the nails should have good hold at the toes of the fore feet; but on the hind feet, the hold should be in the quarters, because the horn is thin on the toes. The second rule is, "Never to open a horse's heels." That is, in paring the foot, do not cut the heel away. The third rule is, "To make use of as thin and small nails as possible;" and the fourth, "To make the lightest shoe be without spot, or whiteness, then the eye will shoe with thick heavy shoes, and seldom, are debe good."

"OF THE AGE."

"Another certain mark of old age [having de-light. Do not pare your horse's feet almost to the light. Do not pare your horse's feet almost to the

and ugly, then they colour their eyebrows that frush." He vehemently condemns calking, or heels turned down,-" Unless in time of frost, beknowledge in selling horses, consists in how to cause necessity hath no law; and it were better cheat, and in buying, to detect the tricks of the the horse should spoil his legs, than the rider dealer. "It is an infallible maxim (says our should be in continual hazard of breaking his." [neck].

ON SHEEP.

Hants, Oct. 2, 1821.

SIR-Volumes have been written on the most wind; nor to any profit, they are so sluggish and profit, or they had been abandoned for stock of a unweildy.

ON WHEELS.

September 22, 1821.

SIR-I wish your correspondent J. C. had obedient and humble servant. given a true account of the difference in strength between a bended axle and a straight one, or reference where it might be obtained: I would not again have attempted to trouble you, or even if RECEIPT FOR MAKING GREEN GRAPE these bulls; and Chapman's Son of Punch, surethat which he hath given would have applied to the bended wheels, in the way he has represented it.

If he understands how to tree a bended wheel, he must know the downright spoke should always be vertical upon a level surface, and therefore capable of supporting as great a weight as the straight wheels, beside the additional advantages of counteracting the side swings and blows by the hurters against the boxes upon uneven surfaces.

If the under spoke was not vertical, the wheel would bind upon the axle-tree, and grind upon the inner edge of the shoe, similar to the flat sole upon a convex road; and I should be glad if J. C. would teach me, or any of your readers who are nest British wine that can be made. inclined to believe his statement upon the bended scantling, what portion of the weight the upper spoke sustains: I conceive the greater the pressure upon the under spoke, the greater the tendency to raise the opposite one out of the nave.

Iam sorry, Mr. Editor, to see that you advocate the cause of flat soles, † when I should have every quart of berries so pounded, put the flat sole can in no thought you convinced that the flat sole can in no when it is to be drawn off; and to every gallon of case wear out the middle more than the edges, except by chance they run upon a convex rib:

retain its original shape the longest? has perhaps as much of Hubback blood in it, as any other breed in the kingdom (not even excepting that of the Messrs. Colling), as the Sockburn cows in my brother's time had access to both ly, had his proportion.

But I am by no means reconciled to the idea that Mr. C. Colling himself ever thought so highly of this bull, (for he only kept him two years,) as is now so confidently held out; otherwise would he have parted with him at seven years old, a nameless bull? for it is well known that he was not called Hubback till many years after he had been sold to a gentleman of that name, at North Seaton, in Northumberland. We hear, indeed, of Sons of Hubback, and if ever Mr. C. had any such, the two yearlings, above alluded to, must have been of them. Not one of Messrs. Collings' own bulls (their best bulls, as Major Rudd has it) could call him sire; and it is surely most wonderful, that they should have never thought it worth while to keep one of his begetting. The long lines of bulls from Fuljambe (the son of the Black-The long well bull) to Cecil, and from Punch to Pilot, have sprung from the loins of Mr. Hill's Blackwell bull; and that no virtue is allowed to have been found in any blood, but in this drop of the Kyloe, in the veins of Hubback, is most wonderful. Mr. Hill's bull, besides being the sire of Mr. Barker's Bull, and the Sockburn bull, was also the sire of George Coates' old bull, which won the premium in 1791. These plain statements need no comment. I am, Sir, your humble servant,

JOHN HUTCHINSON.

ON PLOUGHING.

October 3, 1821. SIR,-About 30 years ago, on the banks of the Gallawater, four oxen and two horses used to draw, or rather drag, a thing we called a plough; and a surly old fellow, who held it, was sometimes scolding the driver, sometimes the oxen, sometimes the horses, and sometimes beating or thrashing all the seven of us. Such scenes, however, I believe, are for ever passed away from the south-east of Scotland, and it is now about 25 years since that these oxen have been fattened on

cattle which already scour on high land; then the Scouring young cattle, but on marshy hastures, PEDIGREE of IMPROVED SHORT-HORNS. change may remedy the evil, and vice versa. where the soil is clay, and the fences ditches, are generally cured of the disorder by eating the tender tops of reed.—Probatum est.—ED.

appeared to be meant; believing that this would breeder in this district to do, as no bull (as I will

I therefore cannot help feeling very sorry to see so many scores, and so many hundreds of English Mr. Small's; I mean his modern chain ploughs. But though a good plough be a very good thing Montrose Chronicle. on a farm, a good ploughman is a great deal better. The setting of the irons, regulation of the traces, collars, and other harness, with skilful driving, are of the utmost consequence; one man may plough with much less fatigue to himself and horses, than another, though with the same implement, for when a plough is properly set, plough-foot to the horse's shoulder; so that the horses do actually lift the plough and furrow, rather than drag forward a dead weight. bag of corn by the mouth, and he will drag it across the floor with tolerable ease; but tie a long rope to the mouth of the bag, and be at the far end of the rope, it will break his heart to drag it but a few yards: this case is not exactly similar, but it is near enough. Hence the attaching of wheels to ploughs is founded upon ignorance, and calculated to promote ignorance and comes useful to a plough, the worse the construc-tion of the plough must be: the irons of such plough must be forever endeavouring to get into the The collection for the poor fellow was but small centre of the earth, and the wheels as constantly endeavouring to bring them to the surface; for my part, I should as soon think of having a pair the market house in Guilford (a distance of however, it is seldom found, a moiety of its of wheels to my scythe, as to my plough. Where twelve miles), in two hours, for a wager of £50. soils are light, the difference is not so much per- He appeared rather distressed on entering the ceived, because the draught, though greater than town, but had five minutes to spare on comple-further and very considerable aid from the states it need be, is still moderate; but it is a great ting the distance. pity that farmers on stiff soils, should imitate their example. A great broad-wheeled wagon tain Smith and Mr. Honywood took place on the great object sought to be attained by the druple chance of accidents; for if even one horse his horse refusing to leap a hedge. wants to make water, the whole team must wait on him: add to this, that a long train of horses walking up every furrow, batters the subsoil like the bottom of an artificial fish-pond, so that the communication between the bowels of the earth and the atmosphere is completely blockaded, and the soil on the surface is as it were, spread upon a floor of ice, so cold and damp is the puddled mass. In short, I look upon good ploughing as the first step towards good farming, and the depth of a farmer's judgment may be measured by the depth of his plough furrow.

I am, Sir, your very humble servant, A GALLAWATER PLOUGHMAN.

On Sunday se'nnight a lark, pursued by a hawk, lighted for shelter on a woman who was sitting in a field near Torthorwald. The hawk was so House of REPRESENTATIVES .- May 3, 1822. rapacious as to make several attempts on its in-tended prey before it could be driven off. But another inquiry reentire work in three years, from the date of the years, its cost will be distributed over the revemains-Has Congress the power to insure its first instalment. success?

So numerous and so various are the benefits accruing to every nation from inland navigation, so of the contemplated canal at two millions and a low a rate of interest as four per cent; that, by urgently have the United States been invoked by half of dollars, your committee recommend that the completion of the entire work in so short a the character and genius of their institutions, to an amount of stock, in the capital of the Compadiffuse their advantages over a territory, which nature has eminently fitted to receive them, that a former Congress sanctioned, by their voice, a reimburse the present stockholders, including the ceeded the principal of their stock, will be presystem of internal improvement co-extensive with states of Maryland and Virginia; and that the vented; that if the dividends of the Potomac the wants of the nation.

Your committee are not unmindful of the impediment which arrested the progress of that ditional works required to complete the canal. system, and could not expect success in their present effort, in behalf of one of its objects, if the proposition which they are about to submit to the House of Representatives were liable to similar objections. The committee have studiously sought to guard against their application,

Two proposals have already been offered to commissioners to survey the route and estimate the expense of a navigable canal, seems to your state; and as an incorporated company already exists, with ample authority to make the contemplated improvement, there does not remain any apparent necessity of waiting for the prosecution of this work, until a more extensive system of internal improvement be devised by Congress.

The committee simply recommend the com-bination of the proceeds of sales of the public property in the City of Washington, which, according to the original plan of the City, was designed to be sold, with such sums of money as the Legislatures of Maryland and Virginia and the citizens of those and of the adjacent states may voluntarily subscribe, for the purpose of extending a navigable canal from the foot of the Little Falls of the Potomac, to the commencement of the Cumberland Road. They propose to annex to this public and private subscription, the condition, that the Potomac Company shall previously assent, with the approbation of the Legis-latures of Maryland and Virginia, to such alterations of their present charter, as will admit the United States, those states, themselves, already interested in the stock of the company, and the new subscribers, to participate, on fair and equitable principles, in their future revenue. These alterations would, among other obvious effects, provide for the payment of the debts of the Company, and for the reduction of the nominal, by for national purposes. They do not extend some liberal reference to the actual value of their the present stock.

contemplated improvement of the navigation and commerce of the District of Columbia shall have caused the anticipated appreciation of their value, as well as to complete the canal in the short- jections which this, like any other plan of interest possible time, without drawing immediately for large sums upon the public Treasury, the They are contented to set against such objections states of Maryland and Virginia, and the individual subscribers of new stock, your committee with the Cumberland road, it will complete a propose, that the United States shall borrow, on great national object, calculated to perpetuate the public faith, and a specific pledge of all the Union, and to promote the prosperity and

CLIMATE AND SOIL ON THE BORDERS OF LAKE ERIE .- Extract to the Editor.

PHILADELPHIA, July 20, 1822. Dear Sir,-I have received your favor of the 18th inst. informing that you had forwarded my letter to your friend, Mr. Wright, who had sailed for England.

You have enquired whether the winters, where the property I have offered for sale is situated, are not too long, requiring stock to be fed for too great a portion of the year? I answer, by no means. The whole extent of Erie county upon the Lake, say forty miles in length, and nine miles deep to the ridge which runs parallel with tive and well directed exertions are making for the lake, and divides the waters of the Alleghany and Ohio Rivers from those of Lake Erie, af-in Talbot county, of this state, on the 7th and fords a delightful climate, and gives certain and 8th of next month. The farmers of that Shore very abundant crops of small grain. I speak are co-operating, zealously, to give eclat and bank of Lake Erie more than twenty years since, with the intelligence and energy of our fellowremarkable fact that the crops of corn have been their success in laudable enterprises, such as this; wards the promotion of Agriculture and Manu-uniformly abundant since the first settlement of the very spirit and object of which, tend to banish factures. the tract of country to which I have alluded above, discord, and to insure unity of feeling and actionand that there has not been a single failure-not an association to improve the art of cultivating a single instance of the corn having been injured the earth—to give encreased efficacy to labourby frost. This is, no doubt, to be attributed to the influence of the air from the Lake, in a great measure. As to grass or grazing land, Erie country is not excelled by any part of the United States. I doubt, indeed, if it is equalled. The winters commence in December—generally about the tenth of the month—from that period, till about the twelfth of February, it usually snows most indiciously offered. We are glad to learn, about the twelfth of February, it usually snows most judiciously offered. We are glad to learn, once in three or four days, so that grain and grass that many gentlemen of this Shore, both amawill be completely protected from the severe teurs and practical farmers, propose to go over. frosts. From the twentieth of February, the snow begins to disappear, and thaws very gradually—
Early in April, cattle that are not used find a sufficiency of vegetation, even in the woods, to keep them in good heart. I will venture to assert, that if cattle were turned out so early in any part of Pennsylvania, east of the mountains to forage for themselves, they would perish—
Rain seldom occurs during the winter months.
The atmosphere is dry and very favourable for accurdance for the severe leurs and practical farmers, propose to go over. This is as it should be. Let us, however, bear that it is, however, bear that this will be their first attempt, and we should graduate our expectations according we should graduate our expectations according to mind, that this will be their first attempt, and we should graduate our expectations according to we should graduate our expectations according to mind, that this will be their first attempt, and the we should graduate our expectations according to mind, that this will be their first attempt, and the fact of the excellence of these cattle for symmetry of shape, kind feeding, gentleness of temper, quantity and quality of milk and butter, facility of taking fat, and for action and strength as the farm of the sign of according to the excellence of these cattle for symmetry of shape, kind feeding, gentleness of temper, quantity and quality of milk and butter, facility of taking fat, and for action and strength as the farm of the form of the second provided to see in other parts of the second provided to see in other parts of the second provided to see in other parts of the second provided to see in other parts of the second provided to see in other parts of the second provided to see in other parts of the second provided to see in other parts of the second provided The atmosphere is dry and very favourable for accustomed to see in other parts of the State. cattle. > The Maltese graft their orange-trees on the na mixed with the agreeable bitterness and fla-

vour of the Seville orange."

Some authors are of opinion that the orange was the golden apple of the Hesperides; and large oringes, which trees, with the boxes, and as the ancient Europeans could not propagate it, was said to have been taken back by Minerva. The fable states, that Hercules, to obtain information of this garden, seized Nereus, god of the sea, in his sleep, who directed him to Africa. If he had to cross the deserts of that is one legent tree with another and using evaporation. In this way a saline extract may be made, capable of being preserved, tract may be made, capable of being preserved. The juice of oranges is a pleasing acid, and Africa. If he had to cross the deserts of that country to obtain this fruit, the allusion of it's being guarded by a dragon, is both natural and just.

The sayd garden-house there now allsoc tract may be made, capable of being preserved, and possessed of the same medicinal qualities as the juice, which is said to be very powerful just.

The Seville orange is esteemed far preferavalew at three poundes a tree, one with another, in toto, £18. 0s. 0d."

There were also eighteen orange-trees that both and the same than the word and corrobother than the same that both and the same than the same that the same than the same than the same than the same than the sa rant. It is warmer than the peel of lemons, of were valued at £5 a tree, one with another, light, fragrant essential oil, which is lodged in A white marble fountain, with a statue of distinct cells on the surface of the peel. The Diana upon it, and "a fayer led cestern belade, and the richest wine: it is from the flowers of this kind of orange, that orange-flower water is distilled. These oranges are often pre

作连续打大星 医太阳性抗缺乏

admired.

The seeds of the orange kind will be found, on nice examination, different from the seed of any other fruit. They have been anatomised by the curious, and, with the aid of a good microscope, are found to be almost as wonderful, in the latter country. their formation, as the human frame when dissected.

Seignior Francisco Lana, in his Prodromus to some philosophical discoveries, tells us, that there is a way of producing oranges, without sowing or planting the trees, only by infusing the flowers in oil of almonds; for that this oil will, every year afterwards, at the proper season, produce both flowers and ripe oranges.

PEACH,-PERSICA, OR AMYGDALUS. In Botany, a Genus of the Icosandria Monogy-nia Class.

All the ancient authors agree that the peachtree is a native of Persia; and it appears that the fruit was thought to be of a poisonous nature. It is evident there had formerly been traditionary tales of this fruit having been sent into Egypt to poison the inhabitants. Columella says, in his tenth book :-

And apples, which most barbarous Persia sent, With native poison arm'd (as fame relates): But now they've lost their pow'r to kill, and yield Ambrosian juice, and have forgot to hurt; And of their country still retain the name.

Pliny, in his 15th book, chap. 13, mentions, that they had been stated to have possessed venomous qualities, and that this fruit was sent into Egypt by the kings of Persia, by way of revenge, to plague the natives; but he treats this story as a mere fable, adding, that the name of Persica evidently bespeaks them a Persian fruit. Cate has not mentioned them; and Pliny adds, that it was not long since peaches were known in Rome, and there was great difficulty in rearing them. He informs us they were brought from Egypt to the isle of Rhodes, where they could never be made to produce fruit; and from thence to Italy. He says, moreover, that it was not a common fruit in Greece or in Natolia. This author states again, in book 23, chap. 7, that he considered it the most harmless fruit in the world; that it had the most juice with the least smell of any fruit, and yet caused thirst to those who ate of it.

Peaches were evidently cultivated in France at an early period, as Columella continues his account of this fruit, by stating,—

Those of small size to ripen make great haste; Such as great Gaul bestows observe due time, And season, not too early, nor too late.

Pliny says, book 15, chap. 12, "as for the French and Asiatic peaches, they bear the name of the regions and nations from whence they

It is stated that the peach-tree was not cultivated in England before the year 1562; and by whom it was first introduced, or from what country it was procured, we have no authentic account, although Gerard wrote his work soon af-ter, which was published in 1597, wherein he describes the white peach, the red peach, the yellow peach, and the d'avant peach, and adds, "I have them all in my garden, with many other

The peach-tree, he continues, "soone cometh

served whole as a sweetmeat, and are justly peaches, white and red, there can be little doubt an aperient to children, and are recommended as but that it was introduced as early as the reign of a great destroyer of worms.

Henry the Eighth. I am decidedly of opinion It should be observed not to get the flowers that it was brought into England, from Italy, by from those peach-trees that have been grafted Wolf, the king's gardener, in the year 1524, as at upon almond-stocks, as the flowers partake of the

Of this deliciously melting fruit we have now a great variety, from the small nutmeg peach which ripens in July, to the large October peach, which is more agreeable to the sight than the palate.-This fruit has been almost equally multiplied in its varieties with the apple, by sowing the stones, and lately by the ingenious method of impregnating the blossoms. T. H. Knight, Esq. President of the Horticultural Society, has procured a new peach by this operation: he impregnated the pistillum of the blossom on an almond-tree, with the pollen of the peach-flower; and this almond, when planted, produced a peach-tree instead of one of its own kind, and has since ripened peach-

The peach varies so much in quality, that many sorts are not worth the growing; it is therefore to be hoped that we shall soon have them At Montreuil, a village near Paris, the whole population is exclusively employed in the cultivation boughs in every part of the tree, as it produces of peaches, which has maintained the inhabitants its fruits from the young wood, either of the for several ages; and the consequence is, that same, or at the most of the former year's shoot. they raise better peaches than any other part of France affords.

I have often observed, that the finest flavoured peaches have been gathered from trees of the greatest age; and I have met with many instances of these trees bearing amply when they have been from forty to sixty years old. These trees generally yield a crop, when younger ones fail.

Father Hennepin, a religious missionary, who first described the regions of Louisiana in his voyages down the Mississippi, gives an account of the numerous peach-trees which he observed m every direction in that part of America; and as the latitude is the same as that part of Asia, of which these trees are the natural production, there can be no doubt but they are indigenous to Louisiana as well as to Persia, although in many parts of America the peach is regarded as a foreign fruit, it having been introduced from Europe before Louisiana had been explored.

This fruit is now cultivated with such success in some parts of North America, that it is not uncommon to see orchards containing 1,000 stan dard peach trees, which are so productive, that the fruit is used to fatten swine: from a single orchard have been procured, after the pulp is fermented and distilled, 100 barrels of peach

Peaches are forced with considerable success. These of necessity must bear a high price in the chap. 2, as being then exceedingly numerous in market, so long as glass continues an object of heavy taxation. The expense of fuel, it appears, than the country from whence they came, as the will not be so excessive, since the heating of flues by steam promises to answer.

It is observed, that the best peaches of every kind are red next the sun, and of a yellowish cast towards the wall: the pulp should also be of a yellowish tint, and juicy; the skin thin, and the stone small. To have them in perfection, they should not be gathered until they will fall

into the hand by the slightest touch of the finger.

This is one of the fruits in particular which is recommended to be eaten in the morning, in preference to the usual time of dessert. Brookes says,

this time we find that he brought the apricot from property of the stock, which greatly alters their the latter country.

The plum is a purgative, the almond not at all so.

Gerard also says, "the leaves of the peach-tree boiled in milk, will destroy the worms in young children."

The young leaves are used by cooks to flavour blanc-mange, custards, puddings, &c.; and a liquor resembling noyau is made by steeping peach leaves in white brandy, and, when sweetened with sugar-candy, and fined with milk, it is difficult to distinguish it from the flavoured cordial of Martinique.

Michaelmas is the time recommended for the winter pruning of the nectarine, as well as the peach-tree, when, with little attention, the blosom-buds will be known from the wood-buds; the latter being less turgid, longer and narrower, than the blossom-buds. In shortening the branches, observe to leave a wood-bud at the endinstead exploded, and the better varieties cultivated in of the fruit-bud. Care should be taken to nip off situations most congenial to their tender nature. the ends of the strong shoots in the month of May, which will cause them to throw out new

Peach-trees are often injured by a desire to retain too full a crop on the branches, which not only prevents the present fruit from coming to maturity, but, by exhausting the tree, prevents its fruiting in future years. When the peach has attained the size of a small gooseberry, the trees should be carefully thinned, leaving the fruit not nearer than from four to six inches to each

From the wood of the peach-tree the colour called rose-pink is procured.

PEAR.-PYRUS.

In Botony, a Genus of the Icosandria Pentagynia Class.

The accounts we have of this fruit are of great antiquity, as the pear-tree was consecrated to Minerva previous to the olive.

The earliest writers mention it as a fruit growing abundantly in Syria and Egypt, as well as in Greece; and it appears to have been brought into Italy from these places, about the time that Sylla made himself master of the latter country; although there is no doubt but the Romans had several kinds of this fruit before that time. Virgil speaks of pears which he had from Cato; and Columella mentions a considerable variety of pears. Pliny writes of them in his 15th book, Syrian, the Alexandrine, the Numidian, the Grecian, the Picentine, the Numantine, &c. &c.:" but of all the pears, he mentions the Crustumine as the most delicate and agreeable; next to that the Falernian pear was esteemed, and so called for the abundance of juice it produced, which he compares to wine. The Tiberian pears were so named because they were the sort Tiberius, the emperor preferred; others were named after the persons who had introduced or cultivated them; some from the season when they ripened, as the barley pear, &c.; and many from their odour, as vp; it beareth fruit the third or fourth yeer after it is planted, and it soone decaieth; and is not of long continuance." From this account, and finding it in the list of fruits, published in the year 1557, by Thomas Tusser, who mentions of the property of the peach-tree are used in medicine: when made into a syrup, they are given as large product the aromatic and laurel pears. "Some are reproducted," says he, "with the name of proud pears, because they are earliest ripe, and will not keep:"there were winter pears, and pears for bak-dicine: when made into a syrup, they are given as ling, &cc. "Both pears and apples," continue this

author, " have the properties of wine, on which account the physicians are careful how they give them to their patients; but when sodden in wine ture of it. The blossoms are commonly producand water, they are esteemed wholesome." Again he states, book xxiii. chap. 7, "all pears shoots, and, as these are often cut off by the unwhatsoever are but a heavy meat, even to those in skilful praner, it prevents their producing fruit,

The blossoms are commonly producby prodigious distress, and extensive ruin to the
productive classes in moderate circumstances.—
The same coincidence has occurred in this coungood health, and the sick are debarred from eating of them; and yet, if they are well boiled or which overful the tree with wood. The summer of agricultural labour, especially have fallen, baked, they are exceedingly pleasant, and moderately wholesome; when sodden or baked with honey, they agree with the stomach."

Some pears were used as a counterpoison against the venomous mushrooms; the ashes of the autumn. the pear-tree wood are also used for the same

medicinal purpose.

The wild pear-tree, as well as the crab-apple, appears to be a native of this country, where it is often found growing, particularly in Somerset-

shire and Sussex.

At what period the cultivated pear was first brought into this country we have no account; but we may surmise that the Romans did not neticular volume; every country, says he, " hath his peculiar fruit; myselfe knowe some one curious, who hath in one peece of ground, at the white thorn. point of three score sundrie sorts of pears, and those exceeding good; not doubting but, if his might have gotten togither the like number of those of worsse kindes. same time that those monied prices were also actions of the latter. reduced one half by legal enactment, the consefooting, rendering every one his due, without persons, who have been endeavouring to accompartiality or injustice, and not lacerating and plish it by a measure which has confiscated the destroying one half of the community for the unjust aggrandisement of the other half. The landlord would have received half the monied that when the present generation of men have the person and bred up or received to manhard the the creditor half the monied debt, and the King half the monied tax; but under this had occasioned, it was not wise or expedient to half, the same value would have been comprised as was comprised under the whole during the war, and thus every class of society would it carried change into every mind, should carhave been preserved on the same relative level, without the least injury or injustice to any one.

But if it was not wise or expedient to reduce without the least injury or injustice to any one. But if it was not wise or expedient to reduce But in reducing hrice one half, without reducing by law the component harts of hrice, at the equally the component parts of price, in reducing thus the monied means without reducing itself; and if it was still more unwise and uncorrespondently the monied charges, Parliament just to reduce the monied means without redu-has thrown the whole burthen of this great cing correspondently the monied charges, what change upon the active and useful classes of the community, and has even contrived that it shall ought we now to have recourse to? I have redouble the fortunes of the unproductive classes, peatedly shewn in your Journals, Sir, that we until such period as the outcry or bankruptcy of ought either to have continued the paper curtheir unhappy victims shall compel them to make rency of the war under proper limitations and a just reduction in their enormous and iniquitous demands.

terms in which men had been accustomed to country had become depreciated during the war. estimate their fortunes, and the monied values By reducing the weight of our ancient metallic of their property and labour, would have been disagreeable to the feelings of many individuals. They would have fancied themselves injured, although they would not, in reality, have been although they would not, in reality, have been a real cheapness of all commodities, at the the same security, and the same command over nominal high prices of the war, and would have the necessaries and luxuries of life, as he possessed on the average of the ten years ending without outraging the prejudices of any.

The late war; and thus all the injury which could possibly have arisen to any party would have been perfectly ideal. The King, and his creditors, retainers, and dependants would have contained the same nominal reduction—were contracted in money which did not contain their incomes, as would have been experienced the same nominal reduction—any intrinsic value whatever; and therefore, if by the land-owners and manufacturers, and their the quantity of silver or gold contained in the the estate; and the creditor would have receiv- sic value which he was no entitled to. ed his just and rightful share of the effects of the debtor. All these great rights and interests would have been secured to the rightful parties just as well under the low estimation of national values, as they were during the war un-der the high estimation of those values. But in cable standard. They would have been brought reducing one part of the national values with-down at once in metallic value to the continental out reducing all other parts; in reducing the level, at the same time that they would have es, the Legislature has condemned the former accommodated.

thus reduced one half by legal enactment, at the to perish without hope, under the arbitrary ex-

Under this view of the subject, which would quence would have been, that the monied bur-thens would still have borne the same relation to the monied means as they bore during the toring low firices, it is probable that such natiwar, and the action of the whole social machi-onal object may not appear quite so desirable nery would have been preserved on the same as it has hitherto appeared in the eyes of many rent which he received during the war, the been born and bred up, or reared to manhood clergyman would have received half the monied and advanced age, under the habits and associatithe, the creditor half the monied debt, and tions which a high estimation of national values

metallic standard of value, depreciated in the It is true, that this reduction of the nominal same degree as the practical currency of the Each individual would have possessed just same time that it would have preserved all the secured the rights and interests of all classes,

by the land-owners and manufacturers, and their the quantity of silver or gold contained in the creditors, retainers, and dependants; but the instruments of money is to be any measure of same reduction would have been common to all. And if low prices, and the low estimation contracted in such money, the annuitants and of national values, are beneficial, all classes would have equally participated in that benefit; or if such low prices are injurious, all classes entitled to. They would have received ten old would have sustained their just proportions of Mint chillings as the intrinsic value contained in such injury. The lessee would not have become every pound sterling of their credits or annuities, bankrupt to the lessor; the mortgager would for which they never advanced one single farnot have been sacrificed to the mortgagee; thing of intrinsic value. All the value which they and the creditor would not have become the ar-biter over the fate of the debtor. The lessor of this description of value every one would have would have received his proper proportion of received the exact amount that he was in reality the produce of the farm; the mortgagee would entitled to, at the same time that he would also have received his just and rightful share of have received a very heavy security in intrin-

In this manner, all British interest would have been brought to contribute, in just and equal proportions, to the grand object of obtaining a metallic coinage; but, in the present mode of proceeding, the whole burthen is contrived to be thrown upon the productive classes of the community, and the very ruin and destruction of these classes. is made the means of a most unjust and unnatural. aggrandizement of their unproductive rivals.

But if this mode of obtaining a metallic circulation was not deemed advisable, and if no other metallic standard whatever but the antiquated standard of 1791, would have satisfied the rapacity or the prejudice of Jews and Lawyers, there was still another mode by which even that object might have been obtained, without injury or injustice to any one. If a prospective action had been given to the metallic standard instead of a retrospective action; if it had been adopted from any given day, and all obligations contracted after such day had been ordered to be discharged in such standard, leaving the obligations contracted in the paper standard to be discharged in the paper standard, in this manner we might have restored the metallic standard of 1791, or even the standard of William the Conqueror, which was about as applicable to the existing relations of society, without the least difficulty, injustice, or distress, towards any class of the community. For a short time, whilst the accounts and obligations of the paper standard were being settled and wound up, we should, of course, have had two prices, but we should have experienced no difficulty in that, nor any more inconvenience than is experienced in Russia, Jamaica, and other countries, where two prices exist. The paper standard, and the metallic standard, would quickly have found their due relations to each other, and would have discharged each other's obligations accordingly. In this manner, every man's rights and interests would have been properly guarded; and if there was no depreciation in the paper currency, no difference would have existed between the two standards, and the one might shortly have been merged in the other; or if any difference did exist, whether 4 per cent. or cent, per cent., such difference would have effected only the proper parties. But in adopting the ancient metallic standard, and giving it a retrospective action, in first inducing the nation, for twenty years, to contract prodigious public and private obligations in a fititious standard, and then compelling all such obligations to be discharged in a real standard, we have committed an act of gigantic injustice, in comparison with which, as Lord Carnarvon justly observes, "all the robberies of the French revo-lution sink into nothing." We have passed an ex post facto law, which confiscates the whole property of the farmers and land owners; which compels the merchants and manufacturers to toil for years, and to reap ruin as the reward of their labour; and which, by loosening and disorganizing all the ties and sympathies which hold the fabric of society together, prepares the sure and not far distant destruction of the whole.

Reverting to the situation of unhappy Ireland, Sir, it may be asked, why England is not equally distressed, if indeed it is true, as I have proved in your Journal, nearly the whole of the present Irish distress is attributable to the unjust measure

which I deprecate.

The capital of the English farmers at the peace, was at least ten times as much as that of the Irish farmers, who, as I have said before, are in general little cultivators, occupy only five or ten acres of land. The English farmers are, therefore, fictitious means of the productive classes, with-been preserved in nominal value at the Bri-out at the same time reducing correspondently the fictitious charges of the unproductive class. been founded, or to which they had long become the fictitious charges of the unproductive class. ed more readily into the dust. Besides, one half of

merce, which now that British manufacturers are your obedient servant, reduced one half in price, requires nearly a doubled your obedient servant, THOMAS ATWOOD. quantity to satisfy the present demand. The effect of this contact with foreign circumstances is visible also in the north of Ireland, where the existence of the great linen manufactures tends to support the population in a state of comparative post, the last Dublin paper I have received. I contrary to the principles of political economy to The population of England are supplied with em-horrors never yet witnessed under the sun. The save the lives of millions of our fellow subjects; hloyment by the continual sacrifice of the capital of the merchants and manufacturers, which is an-proved quite inadequate: famine and pestilence are to be observed only for our destruction, capital of the farmers and land owners, which is sist in forcing on the tremendous experiment.—
still more rapidly taking effect. Sconer or later, one of these great links must give way, and probably they will both give way at the same time. There is successful a pound note in circulation here: guineas and sovercigns have long since disbably they will both give way at the same time. The population of England will then be thrown coin alone remain. Now, Sir, I ask, if all the provious us a Parliament and a Ministry, whom they will have no sister island to relieve them.—

The destruction of the present race of farmers force? What can they earn or obtain, to give in cannot be effected without producing ultimately exchange for them? Having first called on the of our misfortunes; that is almost impossible. I such a deterioration of cultivation, as must inevitably terminate in famine. It will be countermedy the mischief they have done, his Majesty's acted for a while by the recruits from the monied Ministers now unjustly and most wickedly attempt house or the grave. > From the New England Farmer. CIDER.

Cider is our natural beverage. That it is capa-

Agriculture, of which the making Cider is a part, is the first of sciences. Its pre-eminence entitles it to the distinction of the Divine science. But much is left to the reason as well as the labor of man to exalt it to perfection; and in this economy of Providence, who can be insensible to its benignity and condescension in making us joint laborers in the accomplishment of our enjoyments? I am persuaded that you will not think this seriousness as out of place, since, in connexion with basis of institutions for the encouragement of agricultural pursuits. In a pecuniary view, the subject is within the demonstration of arithmetic-in years of usual abundance, it may be computed. made in the common manner; any mode of making which, without material multiplication of ex-pense, shall enhance this price, will add the adtabour, when they knew full well, that its permanent suspension had permanently doubled those prices? The great painter of Nature, when he represents a man attempting an object which Nature shrinks at, makes him call upon elemental darkness, to shelter his designs from his own eyes, and from those of Heaven. a great measure, their existence and aliment from the use of viscous and vapid juices. The proverb, that it is better to pay the butcher than fusing to allow a sufficient supply of legal ten- the doctor, is much exalted in its application to the present subject—it is better to comply with the terms of nature, than to endure the penalties of their transgression. The apple tree, like the vine, is dependant on man; -through his delin-

[&]quot;That my keen knife see not the wound it makes, "Nor Heaven peep through the blanket of the dark:

And on the methods and progress of cultivation, from the "wild disorder" of the nursery to

"The stately tree, which in autumn bends With blushing treasures."

Wouldst thou thy vats with generous wine should froth :

Respect thy orchards ;-think not that the trees Spontaneous will produce a wholesome draught. The plant which shoots from seed a sullen tree, At leisure grows for late posterity, The generous flavor lost."

But as these pleasing and interesting investigations are better adapted to seed-time than harvest, I will pass on to the business of the seasonthe making and preserving Cider. A clean, convenient and covered mill, is the first pre-requiliquor, it is seldom attended with disadvantage, site, for without such a mill, all other attentions and is sometimes the best expedient for its pumay be frustrated. The apples should be reduc-ed to a fine pulp. The colour of the liquor and its smoothness are both improved by laying a few ral state, its smoothness are both improved by laying a few ral state, is the prime inquiry to guide all our de-hours in the trough after grinding. Lay up the pomace on the press in clean straw, without using a drop of water in any part of the process. Three quality of cider at maturity. Generally, the a drop of water in any part of the process. Three or four times as much water is often used in making less than a hogshead of cider, than would be the spiritless white into the golden yellow and required to ruin a pipe of proof spirits. Every mean should be adopted to retain the spirituous property of the liquor-it is its life. If a cider is wanted,

" Some strong, to cheer, The wint'ry revels of the laboring hind, And tasteful some, to cool the summer hours,"

the cheese may be reground, with some assistance from the well.

" Water will imbibe The small remains of spirit, and acquire A vinous flavour."

Press the cheese gently at first, and advance slowly to the utmost power of the screw. Art now commences its operations against the "floating lee"-and in no stage of the business can they be more effectually interposed-in proportion to the clarification of the stum the tendency to an ensuing fermentation is moderated, and its dangerous excess arrested.

In turning up, as it is called, out of the tub, the grossest of the pomaceous mass is usually detained by a strainer of straw, coarser than "the goat's shaggy beard." Instead of such a strainer prepare a tunnel with moveable rims, in the form of of fine flannel-over the second, a covering of baize, and the uppermost overspread with drugget, with the nappy side of each pendant. These strainers will arrest on their way to the vessel, all tend to the agitation and vitiation of the liquor. Should the strainers choak they can be easily re-

We now advance to the preservation of the Cider, which is the principal difficulty; and after all the directions which can be given much must be supplied by discreet observation. The vinous, the to subside is interesting to its welfare. In a cellar that a composition passing any where for Maactous, and the putrefactive, are the three fermentations to which the liquor is inclined—they are, indeed, but one progressive operation, with intermediate pauses. The first is an effort to free itself from a farther association with the fruit, and to excite its own spirit, and is closed with a calmness which marks an intermission of the endance is interesting to its welfare. In a cellar that a composition passing any where for Madeira wine, may be formed of ten gallons of that deira wine, may be formed of ten gallons of that article fure, with ten gallons of Malaga wine, thirty of Sherry, and the same quantity of citary in the same quantity of citary in the first will shew, against which, drawing off may be a safeguard. If placed in an open exposure below the first named ingredient.

"The kinds of stock, and what those kinds will deavor-an advance to the second, which con- "The hoary frosts, and northern blasts, take care verts into vinegar, is restrained only by the due The muddy beverage to serene, and drive ascendancy and retention in the body of the liquor of the spirituous quality excited and quickened by the first-the last is produced by an irreclaimable foulness. The intermission between the two first is short, and has been considered the critical moment for the successful interposition of art, and racking, fumigation, salt-petre and roach-alum, have been specifics relied upon; but more is depending on the internal condition of the liquar, than on these prescriptions, or on any other consideration. Ciders of a good stamina, purified and protected from the internal and external occasions of its injury, by an attention which ought to be as common as washing down a hog before cutting it up, will never depreciate into sourness; nor will any application reclaim that which sunk under the pressure of its inherent impurities, or lost its virtues by the inattention of its keeper. In respect to racking, howe-

The quality of the juice of an apple in its natuthe gorgeous carnation. Hence,

"Let every tree in every garden, own The red-streak as supreme.

"The pippin, burnish'd o'er with gold," is but a grade below. But general rules have their exceptions, and on the present subject a surer cri-terion than outward show may be derived from internal examination-any apple contains a rich fluid, suitable to make a sound, palatable and ex-hilirating cider, which, on breaking, emits an active fragrant flavor-is not over abundantly juicy, and has a glutinous consistency. That the crab will make the best cider, is one of those crude conceits, that every thing is enveloped in mystery, and that we can in no other way escape the foolery which nature is playing with us, than to forsake our senses. It is all important to the full perfection of the fruit, that after having been gathered (which should be done when ripe, in dry weather, with no external injury, and before frosts shall have corrupted it,) that it be spread on covered floors to mellow, and to impart to the air an useless portion of its aqueous parts. Rains and dews hurt ripe apples even while on the trees, but they injure them much more in heaps, or spread in contact with any substance and with each other. While in either of these situations, a seive-over the bottom rim, stretch a covering humidity, according to its degree and continuance, retards or stays the process of maturation, institutes that of decomposition, and impairs the spirituous quality upon which the preservation of strainers will arrest on their way to the vessel, all the cider wholly depends. It should be regarded the gross and most of the subtle impurities which too, as almost equally indispensable to the good quality of the liquor, that the fruit should be se- bring on a fermentation in cider which terminparated before grinding, from unripe and unsound ates in a neat and pleasant wine. It is the pre-apples, and from all filth. The juice of an unripe apple is even more pernicious than that of a de-severe transformation. fective one.

Precipitant, the baser ropy lees.

In this case, racking before a removal into the cellar, (for it ought not to freeze) and again in March or April, may be necessary for the exclusion of the offending matter. The difference in the two modes of treatment already supposed is, that in the first, nature is left to her own unmolested operation, through which her intentions of giving to man a delectable draught, will (if they have not been thwarted by his own remissness) be effectually accomplished :- in the other, she is hastened on in her designs, and the precipitation of the performance requires, that certain of its stages should be seized to thrust out an enemy who is only on rest to recommence commotion.

As to refining cider with matter, it may be given as a rule, that if while on the lees, or when drawn off, the liquor is tranquil, pleasant, piercing, and yet free from asperity, it may be left to itself; or, as is more fit for turoulent acrimonious and insipid bodies, a little tasteless mucilaginous matter of any sort, as isinglass, calves feet jelly, the whites of eggs, or dissolved glue, may be infused to accelerate the precipitation of the particles suspended in the liquor.

The addition of spirit to the expressed juice is a practice condemned by Pomona's Bard—

"With their native strength, Thy wine's sufficient."

A sensible observer, too, of our own, has expressed the same censure. But the subject has its qualifications. The treatment which is sometimes necessary to give a saving soundness to wine, decides against these opinions. Brandy is re-mixed with wine to give it solidity; and grapes of the greatest saccharine richness, affording a juice of nearly the consistency of honey, and easily convertible into spirit, are used to exalt inferior clusters into wine of a high quality.* In truth, it is on this point that intelligent observation must direct. Seasons of luxuriant vegetation produce a more aqueous apple than seasons of sterility. The effect of these different seasons on the quality of cider cannot have escaped notice. In the dry summers of 1805 and 6, a spirituous ascendency in the fruit generally triumphed, in cider, over mismanagement in its making-on the contrary, in seasons of great abundance, and when the fruit is distended to a great size by the watery element, the spirit of cider is reduced to so precarious a standard, that the skilful and rigilant only may boast of its possession in power and purity. In these facts, which a moment's reflection must confirm, we have the instruction we need-if the "native strength" of the juice is sufficient, an aliance should be rejected-if insufficient, an auxiliary may be received, and

* Other, and less notorious secrets in the trade of wine, give the same evidence. Currants, in the proportion of ten gallons to a barrel, will severe transformation.

l shew, reserto the as the fittest is that nearest in affinity. Cider Brandy is the most suitable assistant.

From these remarks, there result as general rules in the making of cider, that apples should be ripe when gathered—that they should be housed to mellow—that they should be separated, before grinding, from the rotten and unripe, and from all uncleanness—that they should be mashed fine in a covered mill, and lay in The most perfect cider, then, can alone be according to the temperature of the weather, avoiding, while in that state, the least appearance of fermentation, which then almost immediately produces acidity—that the juice be purified of pulp and impurites, by passing several contains, and be undiluted by a drop—fraction—that it be placed in cellars, or in colder situation, and left to its own native vigour, or aided by a friendly association, according to circumstances—that it be left "to feed awhile on its own reasonable—next the most perfect cider, then, can alone be general rules.

Of bottling, the advantages are so well unrefielded by the follow-most perfect in the server of the weather, and the nonsenclature nor the same with the nomenclature nor the same will be designated by the amade of its own apple. The most perfect cider, then, can alone be general rules.

The point of perfection in the maturity of fruit can scarcely be said to be stationary for a day; a declension from that point is as detained.

Wide universe, Columbian Cider bore, Shall please all tastes, and triumph o'er the vine." a declension from that point is as detrimental as a deficiency in its attainment; the juice loses its activity, and

"From sprightly, 'twill to sharp or vapid change."

"Some ciders have by art or age unlearn'd Their genuine relish, and of sundry wines Assum'd the flavour."

ous sorts could give one distinct perception to the palate. So invariably does nature preserve the palate. So invariably does nature preserve others in the same way, with equal success. I take our city, with unprecedented rapidity; and take hind by itself, that no two sorts can be drawn into union on the same stock. The disagreement in the juices of fruit is more or less inveterate when mixed, as they depart from sweet to sour. The mixture of an extremely sharp acid with a luscious sweet, produces apactivity of opposition approaching to effervestence, nor does it cease but with the complete subjection of the mass to the acrimonious adversary. These facts suggest the propriety and necessity of keeping each kind of fruit in its own distinctness. The conclusion I should con-

as the fittest is that nearest in affinity. Cider sider as securely propped in its own reasonable-

made with the usual inattention, may be obtained, and its consumption enjoyed.

So far I have treated the subject with a view to general use, and in this view, a leading noine to the connoissance and in a word, alike tillager—to the connoissance and the connois The exact maturity of the fruit, is the first object of attention in leaving general rules and advancing to a cider than

THE FARMER.

BALTIMORE, FRIDAY, OCTOBER 18, 1822.

We beg leave to remind our City readers that, agreeably to former notice, the next annual Session of the Medical College, in the University of Maryland, will commence on the 28th day of this month. Introductory Lectures will be given, by the Professors, which parents and guardians ought to hear. They will afford a glimpse of the vast range of intellectual pleasures, which their children or wards might enjoy, and should be encouraged to cherish. In this school, they would Some apples do not mature until late in winter—others, not until the ensuing spring. Of I observe in the Farmer of the 30th of August, these, a cider might be made exquisitely fine. I aid in chambers through autumn, and in dry Laid in chambers through the winter expose. I have a flower after the sound of the second of the laid in chambers through autumn, and in dry places in the cellar through the winter, exposed to the action of the air, they become enriched by the evaporation of their watery parts—but at neither of these periods is there so friendly a concurrence of the atmosphere for nessee—he had been subjected to the following the making of cider as in the last month of treatment:—the duct that passes from the eye to the sources of endless pleasure rise in our city, and how to make the making of cider as in the last month of the source of the sources of endless pleasure rise in our city, and how to make the making of cider as in the last month of the source of the sources of endless pleasure rise in our city, and how untasted by her sons? Parents and guarthe nose, was laid bare, or an incision made in the and flow untasted by her sons? Parents and guar-

AMERICAN REBMERS BERINGSON

we may have become blind to their faults; but state of perfect preservation, and is most conveniently placed for the use of students.

We will, nevertheless, endeavor so to speak of DR. POTTER, has discharged the duties of Prothese gentlemen, that no one may reproach us these gentlemen, that no one may reproach us with extravagance, at the close of a session.

was superior in talents to Dr. rotter—that he or Institutes of Medicine, with great delight; for that this great master made of the phenomena of life, of health and disease, under consideration. that this great master made of profession, shews year, sold in Europe for \$32 per landard, and the brought the phenomena of life, of health and disease, under consideration, in the most captivating manner; and memory now recalls those exercises with grateful emotions. The Anatomical School in this University, was raised by mical School in this University, was raised by felicity and knowledge of Anatomy and Phyinferior to no similar sculiar and extraordinary M'Dowell, on the Institutes of medicine, is, M'Dowell, on the Institutes of medicine, is, like his own principles and worth, ever accept-duties of the Anatomical department, to the great advantage of the University and the public. He has latterly, and we think judiciously chosen to concentrate all the powers of his mind, where the transfer of th chosen to concentrate all the powers of his mind, upon the general principles which govern, not only the practice of Surgery, but which attach themselves by numerous points of application, to the whole ground of medical practice. The lectures of this scientific and dextrous surgeon cannot be surpassed. And we are satisfied that the friends of medical science will contemplate his labours with unusual interest, as he has determined to occupy his mind, towards the close of a long and useful career, in the cultivation of medical philosophy.

Constant growth, and we are member of its largest class, which could then scarcely boast a dozen hearers. But now this temple of science has become the chosen resort of quite expediency of attending the Cattle Show at Eastern on the one of the output of the surpassed. And we are satisfied that the lip hope, that our highly respectable school may long continue to increase its magnitude and useful ratio of its early growth, to the honour of our country and benefit of socious long and useful career, in the cultivation of medical philosophy.

We should not take our leave of the University, of farming purposes.

Science, is not excelled in the United States; themen of science, whose lectures may be atland as a scientific man, he may be fairly ranked among the first of any country. His lectures are fine specimens of composition, simple, chaste, and beautiful; they are presented with a diffidence that leads you to esteem the author, whilst you admire his productions.—And when he offers to exhibit facts, the accuracy of his preparations and the excellence of any hear enriched by a heartiful series of specimens. And when he offers to exhibit facts, the accuracy of his preparations, and the excellence of apparatus guarantee success. His experiments are always neat and perfect demonstrations. In his special vocation, we think him ardent to a fault—to the impairment of his constitution. But we look forward with confidence, to an increase of patronage, that may indemnify, whilst it shall visited Great Britain, France and Italy, in search of knowledge; and, as one of their own sons, the special vocation when he offers to exhibit facts, the accuracy collection added greatly to its value; it has since trimmed, \$7.50 to \$3.—No. 2, \$5.50 to \$7.—No. 1, untrimmed, \$7.—No. 2, do. \$6.—Herrings, No. 1, \$3.25 to 3.37.—No. 2, \$3.50 to \$3.7.—No. 2, \$3.50 to \$7.—No. 1, untrimmed, \$7.—No. 2, \$3.50 to \$7.—No. 1, \$3.25 to 3.37.—No. 2, \$3.25 to 3.3

PROFESSOR PATTISON is now the Lecturer on Anatomy. Under the auspices of this gentleman, the anatomical department, during the last two years, has maintained the high rank, which his predecessor gave to it. Thus has Professor Pattison fully justified the high testimonials and friendly commendations, which he received in Great Britain, from men of the first respectability and learning, who knew him intimately as a gentleman, and a votary of science. Careful in his arrangements, he conveys information in a manner so lucid and impressive, as to have made his accuracy proverbial. As a surgeon he is skilful, equals. To him, the Institution and the public are indebted, for the best collection of morbid preparations illustrative of disease, that can be found in our country—it embraces many hundred cases of very interesting character, in a lightened by discourses from his chair.

In the Arts and Sciences—Rev. Mr. Allen, lars. I should be much obliged by thy stating the circumstance in the American Farmer, this and industry in this department, by an approved ededition of Euclid, and an original work on I am yery truly the formal

HORTICULTURE.

POMARIUM BRITANNICUM.

An Historical and Botanical account of Fruits, known in Great Britain, by Henry Philips, -Second Edition.

(Continued from page 235.)

PINE-APPLE PLANT.-ANANAS.

ways appearing at table with a crown.

The ananas is an herbaceous plant, with leaves somewhat resembling those of the aloe.

life, that they are often used to flavour rum, and a wine is made from the fermented juice of the sweeter sorts, nearly equal to Malmsey. Lunan observes, in his Hortus Jamaicensis, that these plants grow most luxuriantly when they are associated together; and the suckers from them are stronger and finer, than when the plants are separated at a distance from each other than the seeds of berries in the tubercles; but the seed where it is cultivated with much care in all the suckers from the seeds where it is cultivated with much care in all the suckers from where it is cultivated with much care in all the other: by this their roots are likewise kept cool-

England from Holland, in the year 1690. In the Fitzwilliam Museum, at the University of Cambridge, is a painting by Netscher, of a landscape with a pine-apple, and there stated to be the first that ever fruited in England, of Cambridge, is a painting by Netscher, of a landscape with a pine-apple, and there stated to be the first that ever fruited in England, which was in Sir Matthew Decker's garden at Richmond, in Surry, grandfather to the late Lord Fitzwilliam. Gough says also, that it was Sir Matthew Decker, Bart. who first introduced to four or five variable and strengthening diet: it is often palatable and strengthening diet: it is often better reduced to four or five variable and strengthening diet: it is often palatable and strengthening diet: it is often belief.

Dr. Wright says pines have a determine the Welbeck-him to do his business, or to keep up his health. The fruit of the plantain-tree is about a foot long, and two or three inches in diameter; it forms a principal part of the food of the negroes, who either roast or boil it, when it becomes a palatable and strengthening diet: it is often boiled in their mess of salt beef, pork, or fish, &c.; many Europeans, when accurate to it. ced the culture of the ananas.

first produced fruit in England, it was deemed and gums than any gargle whatever. so great a curiosity, and of so much impor-tance, that persons of rank came from France, to say, when and where it was first fruited. I vation of the pine apple is now so well underconclude it must have been very rare, even had it in any instance produced fruit, before the year 1716; as Lady Mary Montague, on her journey to Constantinople in that year, remarks the circumstance of pine-apples being served up in the dessert, at the electoral table at Hanover, as a thing she had never before in the shops of the London confectioners.

Should the heating of stoves, by steam, answer we may conclude that she would naturally have to the expected extent and the pine apple is now so well understood in this country, that notwithstanding the bar made by the high price of glass, and the expense of fuel, this fruit is seen in our markets, at one fourth of the price they produced a few years back; and pine-apple ices are already become as common as those of raspberry, in the shops of the London confectioners.

Should the heating of stoves, by steam, answer the roots, which in six or eight mentle and fowls, giving a firmness and exquisite flavour to their flesh.

The plantain is cultivated in Egypt, and most other hot countries, where it grows to perfection in about ten months from it's first planting, to the ripening of its fruit. This tree is only perennial by it's roots, and dies down to the ground when it has fruited, after the roots, which in six or eight mentle and the process and exquisite flavour to their flesh.

The plantain is cultivated in Egypt, and most other hot countries, where it grows to perfection in about ten months from it's first planting, to the ripening of its fruit. This tree is only perennial by it's roots, and dies down to the ground when it has fruited, after the roots which it is cut. we may conclude that she would naturally have met with them at the English tables, had they not been very uncommon.

of been very uncommon.

This fruit must have been known in Engund long before it was attempted to be grown
left, as Lord Bacon mentions it in his Essay

Blantations on Colonies which was published.

The late Sir Joseph Banks says, that it does the foresight of a prophet to foreto foreland long before it was attempted to be grown our streets two for a crown. here, as Lord Bacon mentions it in his Essay The late Sir Joseph Banks

grave obligingly showed me, in the breakfastroom of his beautiful residence of Strawberry
Hall, Twickenham. The painting represents
King Charles the Second in a garden before his
palace at Ham, attended by two of his favourite breed of spaniels, where Rose, the royal
gardener, is presenting his Majesty with the
first pine-apple. This picture was in the collection of the celebrated Horace Walpole,
whose descriptive account informs us, that it
was bequeathed by Mr. London to the Rev. in good condition. As this experiment has A Species of the Bromelia, and of the Class Hexandria Monogynia. Natural Order, Coronaria.

Whose description was bequeathed by Mr. London to the Rev. in good condition. As this experiment has the special description of Ditton, by whom it was presented to himself. He adds, the painting is supposed to be by Daneker. It is probable that the Bermudas, but also from the West India islands. I observed, that those pines which ple from the resemblance it bears to the cones of method of raising the ananas not being correct-the pine-tree. It is considered the king of ly understood, the plants were, by some acci-fruits, being second to none in flavour, and al-

dent, lost in this country, duced a second time.

By an engraving of the pine-apple, which was published by Robert Furber, gardener, at Kensington, in the year 1733, we may judge that the raising of pines was not then brought the raising of pines was not then brought that the raising of pines was not then brought as the fruit is re-It grows wild, in vast abundance, in many parts of Africa and South America; and is cultivated that the raising of pines was not then brought to any degree of perfection, as the fruit is represented short having not more than four contents. in the hotter islands of the West Indies, where it requires but little attention to procure this elegant fruit in perfection and plenty.

In Jamaica, pine-apples have become so prolific, that they are often used to flavour rum, of the other fruits, which seem to be from fine mending to him the use of the cold bath, was

other: by this their roots are likewise kept cooler and moister.

It is stated, that the first pine-apples raised in Europe, were by M. la Cour of Leyden; and the Sloanean manuscripts in the British Museum inform us, that the Earl of Portland had the honour of introducing this plant into England from Holland, in the year 1690.

Inke the seeds of berries in the tubercles; but the pine is chiefly propagated by planting the crowns or suckers, which latter come more quickly to maturity, and are therefore more generally preferred. The most rare kind is the greatest blessings bestowed upon the inhabitants of that climate. Dr. Wright says, the island of the Jamaica would scarcely be habitable without this fruit, as no species of provision could supply it's place: even flour, or wheaten bread lowish flesh, is greatly preferred to the ovallowish flesh, is greatly preferred to the oval-shaped fruit of a paler colour. The Welbeck-him to do his business, or to keep up his health.

Dr. Wright says, pines have a detersive qua-

our stoves since the year 1690.

tree so much resembles the plantain, that is only known at first by the dark spots on its stem, which the other has not. This is a wholesome fruit, and is used at desserts. From it a some fruit, and is used at desserts. From it a from the plantain-tree fibre, which was manpleasant drink is made, exceeding our cider. When baked in tarts, or boiled in dumplings, this fruit tastes like the apple: when dried in the sun, it resembles a delicious fig. It also makes a good marmalade, which is recommended as a great relief for coughs. The fruit of the banana-tree is said to comfort the heart, is cooling, and refreshes the spirits. Labat, states that when the natives of the West Indies undertake a voyage, they make part of their provision to consist of a paste of banana, which, in case of need, serves them for nourishment and drink. For this purpose they take ripe bananas. and having squeezed them through a fine sieve, form the solid fruit into small loaves, which are dried in the sun, or in hot ashes, after being previously wrapped in the leaves of Indian flowering reed.

The fruit of the banana-tree is about four or five inches long, of the size and shape of a middling cucumber; it generally grows in bunches, weighing upwards of twelve pounds. The its peculiar sorts of this fruit.

Spaniards have a conceit, that if you cut this, The Grecians added to their native plums those ways, there appears a cross in the middle of the fruit, and therefore they will not cut any, but break them. The Franciscans dedicate this fruit to the Muses, and therefore cull it musu. The Portuguese call it ficus derta. In musa. The Portuguese call it ficus derta. Lo-dovicus Romanus, and Brocard, who wrote a Description of the Holy Land, call the bananas Adam's Apples, supposing them to be the fruit erroneous as the account of the Abbé Poyart and tree from which our first parents made themselves aprons, as from their size, which is from five to seven feet in length, and from one to two feet in breadth, they could not have required sewing together for that purpose. These leaves are said to be as strong as parchment. The leaves of the plantain, as well as the banana, grows so rapidly, that by placing a thread, they will be found to grow an inch in an hour. The young leaves are so soft, that they are employed in dressings for blisters, &c. When full grown, they are so large that they are used as they are young leaves are so large that they are used as they are young leaves and this fruit appears to have their own species; and this fruit appears to have substitutes for napkins and table-cloths; when

will come out a great quantity of clear water, which is very rough and astringent, stopping all sorts of fluxes.

The fruit of the banana-tree has been ripened in our hothouses; but as the tree grows very tall, the size of the leaves requires more room than most gardeners are willing to allow it in the

From the rapidity of the growth of the banana, it is of too porous a nature to merit the name of wood, and the Indians have ever been accustomed to make cordage, and a kind mate. of cloth, from its fibres. The celebrated circumnavigator, Dampier, notices the process of France so called. This is a handsome but an in-

describe them separately would be endless, as not den Drop. In flavour it partakes both of the only every country, but almost every district, has Green Gage and the Apricot. I have several

then are the wicker baskets cramm'd With Damask and Armenian, and wax plums.

Pliny states, in his fifteenth book, chap. 13, that Eve took and gave to Adam, which is as that there was a great variety of this fruit in Itaerroneous as the account of the Abbé Poyart and ly; and it is not long, says he, since the country others, who state the leaves to be those of the about Grenada and Andalusia began to graft about Grenada and Andalusia began to graft able than wholesome, but like the pear, they lose plums upon apple stocks, which were called apple plums; others upon almond stocks, which he calls a clever devise, as it produced both fruits, the the bullaces and sloes, which are astringent.—

they have furnished stocks for every variety of their own species; and this fruit appears to have been attended to in early days, if we may judge from the variety that Gerard had in his garden kind of jelly called damson cheese. The wild dried, they are made into mats and stuffings for mattrasses, &c.

If a knife be thrust into a plantain-tree, there

score sorts in my garden, and all strange and rare: there be in other places many more common, and Peruvian bark in cases of intermitting fevers. yet yeerely commeth to our handes others not before knowne. The greatest varietie of these rare plums, are to be found in the grounds of Master incent Pointer of Twicknam.

The Damson, or Damascene plum takes its name from Damascus, where it grows in great quantities, and from whence it was brought into Italy about 114 years B. C. Pliny says, this plum required the warmer sun of Syria; we may therefore conclude, it is still more inferior in our cli-

The Orleans plum takes it's name from the part more than a century ago, as follows:

"They take the body of the tree, clear it of it's outward bark and leaves, cut it into quarters, put it into the sun, when the moisture exhales; they then take hold of the threads at the ends, and draw them out: they are as Reine Claude, from having been introduced into

oth in Mindanas, called saggen." of that country, but it bears various names in In Jamaica, there have been upwards of different parts of France. It is often called damas verd; at Tours it is named abricot verd; at Rouen, where it grows abundantly, they call it la verte bonne. This plum received the name of Green Gage from the following accident:-The Gage family, in the last century, procured from the monastry of the Chartreuse at Paris, a collec-tion of fruit-trees. When these trees arrived at the mansion of Hengrave Hall, the tickets were safely affixed to all of them, excepting only to the Reine Claude, which was either omitted to have been put on, or was rubbed off in the package. The gardener, therefore, being ignorant of the name, called it, when it first bore fruit, the Green Gage. The compliment was justly due to the family for the introduction of this excellent plum, which is more acceptable to the country at large, that the trifling respect can be to the family of Gage. Lord Cromwell brought several sorts of plums from Italy into this country, in the reign of Henry VII.: among them was the Perdrigon.

The Bonum Magnum is our largest plum, and greatly esteemed for preserves and culinary purposes. A plum of the same size and shape, but of a yellower hue, has lately been introduced by Plums are so numerous in their varieties, that to a Mr. Coe, of Brompton, and is called Coe's Goistandard trees in my garden at Bayswater, which

desserts with the autumnal fruits.

Dried plums are principally imported from Portugal, and the neighbourhood of Marseilles in France; from whence also prunes are brought: this latter variety is mostly used in medicine.

Plums of all kinds are considered more agreestone being like the kernel of the almond. I have grafted upon nut stalks, he states, retained the form of the mother graft; but they got the taste of the stock wherein they were set.

HOLKHAM SHEEP-SHEARING.

The following poem, descriptive of the business and festivities of the Holkham Meeting, was written by the Editor, and very partially circulating and blessed is he whose talents claised in 1820. It is now given to our readers and the public, not as a splendid poem, but as a faithful record and description; and as a meed of honest though inadequate praise of a character and an inadequate praise of a character and an independent of the spring of all. Her morning song the sky-lark has begun, institution alike unrivalled, and deserving of all possible celebrity from much higher efforts of the Muses.

HAIL, sweet Britannia! fairest child of Jove! Thy children's partial eulogies belong
To thee, the subject of thy grateful song;
Accept the tribute of their filial love;
Thy power, thy laws, and liberty inspire

With praise appropriate oft the sounding lyre, Thee first in fame and happiness to prove, In arms and arts renowned, and blessings from a-

But bolder pens may tell thy praise in arms,
Thy fame for freedom, and thy great renown;
To me the strains of glory are unknown,
In neatness each the other strives to f

And pure domestic bliss has greater charms.
Round the fair fields of HOLKHAM let me stray, Where art and nature mutual force display,

Advancing to perfection those fair farms, Which not the sun alone, but brighter genius But see the cavalcade of grateful friends

Enamoured of the subject of her song, The rustic muse delights in silent mood To wander there, and pour her praises rude, Such as may soothe her native scenes among;—

For poesy oft inspires the humble swain:

Steals half his time, perhaps, and half his Who thus the improvement shews a liberal lease pain:

And though to him no classic gifts belong, He earns a simple fame among the village throng.

And who, without enraptured eye, can see Arcadian scenes, which fancy fabricates? While here and there a shepherd ruminates Beneath the sweet shade of a beechen tree;

And at his feet a dimpling streamlet runs; His flocks still bask in ever-genial suns, Nor fear the knife, but live secure and free : Such are thy magic charms, O sensibility!

All bosoms dance with innocent delight;

The cheerful village swains and lasses trim
Wander in pairs along the winding stream,
Or deck the sloping hills with spots of white;
Or line the hawthorn hedge with snowy sheen,
Or skirt the copse, or gambol on the green:
With nosegays, love disposed, their bosoms dight,
Dearer to them than gold, or Indian diamonds bright.

Recal imagination from her dream, To fix on HOLKHAM and reality,
Where all her brightest forms combined we Proceed, great master of the rural art! see

With truth so fair, it yet does fancy seem; For here the sons of toil are happy; here Sorrow and poverty do not appear!—
On noble minds may this example beam,
And spread to every hall the soul-inspiring theme.

Our noble ancestry of Britain won; But who continues what their sires begun?

How smiled the numerous tribes each happy

year, What time Dan Abraham 'gan his flocks to

Patron of rural arts! their prayers for thee Daily ascend, whose hands thy fields employ, Let joy be rational—yourselves enhance—And mix with all the blessings they enjoy: Teach virtue by example;—mirth with temper-(Sweet is the bread of virtuous industry).

Blessing and blessed is he whose talents claim, At once the landlord's and the patriot's fame :

Her morning song the sky-lark has begun, While Phæbus uphill drives his recking

Aurora first o'er daisy-spangled meads Trips lightly, loosing wide her crimson zone, Once in your lives, ye sluggards early rise, Behold the glories of the morning skies-While dew-drops glitter on the gorgeous sun, And down each blade of grass the liquid diamonds

The shepherds now pursue with nimble strokes Their fleecy task; and often, being dry, The trusty horn goes round; the master's

In neatness each the other strives to foil, And through the day sustains the gladsome toil:

Surrounding nobles hear their rustic jokes, And own them happier than many greater folks.

Surround him, pressing through the numerous fields!

Each its appropriate instruction yields; All he explains, he has no private ends. From farm to farm they ride, from vale to hill, And hail the effects of industry and skill:

Such scenes themselves to every heart endear; Meanwhile is spread the hospitable board, With viands choice, and wines, supremely stored:

defends.

And shepherds quaff apart their cans of beer: Convivial toasts impart their richest zest, And mirth and welcome crown the ample feast.

Old time limps by and gives a longing leer, And fain would stay awhile to taste the bounteous

The goodly hall groans with the gathered throng, From the whole empire drawn and foreign states,

To see the wonders rumour celebrates, And hear the truth recorded by his tongue: But never Fame her brazen trumpet blew, To pour a praise so pure, a note so true; And never did benevolence among Mankind establish facts more useful, or more strong.

Thy country's pride, and friend of human kind-

In fortune great—but greater still in mind.— Happy—unmov'd by envy's poison'd dart;— Thy worthy compeers round—a noble band—

While "COKE, with nine times nine," re-echoes from each part,

And peals of plaudits burst from every honest heart.

But see too soon the evening shades advance; And objects yet important claim regard, Where cattle stand in the contiguous yard ;-

True pleasure dies with reason's vigilance:

Those lengthened orgies only vice admires
From which abash'd the blushing day retires .-

ance.

Hence, these unneeded monitory strains!

For reason here her chief instruction yields, By crops compared on highly cultured fields; In this our country's dearest interest reigns;

Next sheep and cattle, viewed with practised eye, In weight and beauty with each other vie.

Honour to COKE-reward the victor gains-And stock unrivalled graze on our luxuriant plains.

Long may these blessings grace Britannia's isle, And long may her prosperity increase—
In wealth and industry, content and peace:—
(Would these again on agriculture smile!)
And long may HE whose merit claims the

song, Enjoy his well-earned fame these scenes among;

Whose bright example cheers the sons of toil, And lights with emulous fire the yeomen of the

Here forty-and-four* times have friends that love, And strangers that admire him, met, and they Have seen and learned, and gone improved awav:

Reason persuades us-but examples move. Ponder his rules-and may their fruits increase;

I pen no farewell to such scenes as this! Basis of Britain's greatness they shall prove, While freedom nerves her hand, the gift of heav'n above.

* Written in 1820; the last meeting in 1821 made the number forty-five.

-0-AMERICAN MANUFACTURES.

Extract of a letter from Cincinnati, Ohio, to the Editors of the Statesman.

" Having seen several communications in your valuable paper, respecting the art of dying and the cultivation of the woad plant, by which it seems that manufacturers in your part of the country are doubtful, whether woad can be produced in the United States, in the same perfection as in England, I have thought proper to state, for their information, that in 1821, I planted two acres, and found the produce to be at least one fourth more in quantity, having cut seven crops during the season. In England, I never knew more than five. Its strength, as a mordant, exceeded the English at least one third, containing three times the colouring matter I have ever found in any woad, after an experience of forty years, in an extensive trade in England.

I herewith forward to you some patterns of wool, dyed with this woad, and regret I had not preserved some coloured with woad only, by which artists acquainted with the subject, would know its superior qualities. I have always observed in England, that our woad plant produ-Attest their love with voice and willing hand, ces more in quantity and better in quality, in a

succeed until they become well acquainted with this useful plant, as no good blue, black, green, or purple colour can be produced without it All other modes are imperfect, expensive, and mischievous. Having made this country my home, I shall take pleasure in communicating this knowledge, to any one that may need it, for a moderate compensation. Written directions may be given for growing and preparing woad, without any chance of error; but to use it properly, requires considerable attention and good instructions.

I suppose it may be produced for three or four cents per pound-perhaps for something less I have sold some of mine at Baltimore this season for 121 cents, by which you will per-ceive there is great profit in its cultivation. In my opinion no substitute for woad will be found worthy of attention, although it seems your friend *Hopson* thinks he has discovered one, which will answer the purposes both of wood and indigo. Your correspondent will confer a its properties, and communicate the result to

Your correspondent who has written on the scarlet dye appears to be acquainted with only a part of the theory of that art, as two essential ingredients are not mentioned, one of which I have seen since my arrival in this country. Your friend is also in an error in supposing he can render colour more brilliant by using steam. I have made use of steam in dying for nearly thirty years, and am well acquainted with its advantages and disadvantages. It is a cheap and expeditious mode; but it cannot be used for fine colours, such as Saxon blue, green, pink, crimson, scarlet, orange, yellow, and all other delicate colours, but at the expense of their beautu

All dyers should know, that when bright colours are wanted, the first step to be taken is to provement and Domestic Economy. Though it clear the water of all mineral and animal substances. This is all that is necessary to pre- thing," yet there can be no doubt that any young couragement on the agricultural associations in pare the liquor for any bright colour; but if raw man attending with a willing heart to a single his neighbourhood, giving as many hundred, as water be added, or steam suffered to flow into course of lectures, would forever derive satisfactions of the agricultural associations in the agricultural associations and agricultural associations and agricultural associations and agricultural associations and agricultural associations are agricultural associations and agricultural assoc troyed, in proportion to the quantity admit-

the bride, before she entered into the marriage bed, used to eat of the quinces. Columella says, alton states it to be a native of the Levant, and says it was first introduced into this country in 1570. Gerard says, "as there is a wild so likewise there be certaine wild pompions, which grow in Barbarie, Africa, and most parts of the East and West Indies." This author says, "the purple of the pompion is neuer catentary, but boiled in milk and buttered; is not oranges, as some commentators pretend. In support of his argument, he states, that it was a fruit much revered by the ancients, and he astratue of Hercules, that held in it's hand three duinces; "the flesh or pulpe of the same sliced, and fried in a pan with butter, is also a good and wholesome meate:" but he condemns the method of using it with apples in pies.

the bride, before she entered into the marriage bed, used to eat of the quinces. Columella says, quinces not only yield pleasure but health also: the view of this wine, which was made after the following receipt:—

"Cut large quinces in quarters, and core them, as the seeds give the wine an unpleasant flavour; grind them in the same manner as a fruit much revered by the ancients, and he astratue of his argument, he states, that it was a fruit much revered by the ancients, and he astratue of Hercules, that held in it's hand three quinces; this, he says, agrees with the flable with states, that Hercules stole the golden apples for cider, and put to every gallon of water; let it stand a day or two, then strain it off. Should the pummis smell ing, but completely restored to his health by duince of this wine, which was made after the following receipt:—

"Cut large quinces in the same that quinces at flavour; grind them in the same manner as a fruit much revered by the ancients, and he astration of his argument, he states, that it was a fruit much revered by the ancients, and he astration of water; let it stand a day or two, then strain it off. Should the pummis and flavour; grind them in the same manner using it with apples in pies.

Natural Order, Cucurbitacee.

The pompion is a coarse, inferior kind of melon, which has long been known in Europe, as Pliny mentions it in his 19th book, chap, v. newbere he says, cucumbers of an exceeding large size are called pompions. Again, in his and Paphos were decorated with it. The statues of the gods also who presided at the nuples of cyprus and Paphos were decorated with it. The statues of the gods also who presided at the nuples of cool the body, and the fleshy substance applied to the eyes assuaging their pain, &c.

The Quince was called Cydomia, after an island meals, dipped in vinegar."

Quinces grow in such abundance in some parts of the Wealds of Sussex, as to enable private families to make quince-wine in quantities of from 1 to 200 gallons in a season. It is an agreeable wine, that improves much by keeping, and is greatly esteemed by asthmatic personal bed, were ornamented with this fruit; and the bride, before she entered into the marriage-bed, used to eat of the quinces. Columella says, line, but completely restored to his health by

rows, others so large that they weigh the boughs This fruit has lately been raised in the neighbourhood of London to an extraordinary size, weighing nearly two hundred weight. These are sold in the shops of the metropolis, above account of Goropius. The only kind that above account of Horopius, was above account of Horopius. more as a curiosity than for use. I have found was eaten raw, he states to have been raised by them, when boiled in their own moisture, viz. grafting the large quince upon the stock of a without water, an excellent vegetable with meat, having a taste resembling artichokes: with the adds, "all kinds of this fruit are in use addition of the peel and juice of lemons, they now-a-days, within the waiting or presence cham-now-a-days, within the waiting or presenc make an agreeable pudding.

Pompions are used by the Jews in the Feast of Tabernacles, when they form a kind of craevery morning." He also states, that they were dles into which they put a great number of used to garnish the images which stand about the bed's head and sides. the bed's head and sides.

bled, and the Garden Pumpkin. The latter differs from all the rest by having no seed, but is propagated by slips. He says, also, that they are boiled and eaten with flesh meat, and much used by the poorer sort in soups.

In Botany, a Genus of the Icosandria Pentagynia Class.

Linnaus has joined this genus, as well as the apple, to the pear, while Miller separates it on this account: he says, "the pear will take upon the quiuce by grafting or budding, and so vice versa; but neither of these will take upon the apple, nor that upon either of these." But we have a particular account transmitted to us by

been cultivated in this kingdom, as our earliest authors of them. Gerard says, they were often planted in hedges and fences to gardens and vineyards in his time. By the Hortus Kewensis it appears that the quince the reign of Henry the VIIIth, 1537, which is evidently an error, from the circumstance above related by Gerard, who was then an old man.

Quinces are used in medicine, being of an asmired at dessert; indeed all the white fruits of mired at dessert; indeed all the white fruits of

POMARIUM BRITANNICUM,

An Historical and Botanical account of Fruits, known in Great Britain, by Henry Philips,—Second Edition.

(Continued from page 243.)

PUMPKIN, OR POMPION.—PEPO.

In Botany, of the Monæcia Syngenesia Class.

Pliny, that quinces were grafted upon apple-stock, they are grafted upon an apple-stock, they are described upon an apple-stock, they are called Appliana, after Applius, who was of the Claudian House, and who first devised and practised this mode of grafting; these apples, "continues he, "have the smell of the quince, that which they call quiddeny of quinces, than in the bodies of quinces themselves, because they lie heavy in the stomach; but those quiddenies are best taken after meals, alone; before meals, dipped in vinegar."

The Quince was called Cydonia, after an island in the Mediterranean, now named Candia. It

The Portugal quince is the most esteemed. In the pruning of the quince-tree little is required, except to keep the stem free from suck-

RASPBERRY-BUSH.—RUBUS IDÆUS.

The raspberry was but little noticed by the ancients, and that principally on account of it's medical virtues. Pliny does not consider it of so much importance as the bramble, in mentioning which he says, "there is a third sort of bramble, which the Greeks call *Idæa*, after Mount Ida. This fruit is smaller than the In Hughes's Natural History of Barbadoes, the says, "Pumpkins make a great part of the food of the poorer sort, in the summer-time, as well in Asia and Africa as in America." He adds, that they are distinguished in Barbadoes by the names of the White, the Blue, the Marie of raw quinces, he states to be a sovereign repelar. Being taken inwardly, and drunk with polar of the summer of the summer time, are good to be laid to water of raw quinces, he states to be a sovereign repelar. Being taken inwardly, and drunk with

used by the poorer sort in soups.

The jugglers, or quacks, in some parts of eyes. The root of the tree was used more as a Charm than a medicine for those afflicted with sex. It is a fruit that appears to have been America, extract the pulp out of pompions, and fill them with flint stones, with which they make a great noise, and pretend to frighten away all the complaints of their superstitious patients.

Quince-trees grow wild on the banks of the Danube, and they are stated to have been blackberry, although he says it is planted in garbrough into this country from the island of Crete, now called Candia. They have long fruit," he adds, "is in shape and proportion like been cultivated in this kingdom, as our earliest that of the bramble: red, when it is ripe, and covered over with a little downiness, of taste

the berry kind, are sweeter than the coloured, I

ed to about two feet in height: the middle or The timber of the service-tree

SERVICE-TREE.—SORBUS. In Botany, a Genus of the Icosandria Trygy nia Class.

This fruit, which is a native of England, is now as little known, and as rare in the London market, as the fruits of the most distant parts of the world; and the service-berry-tree is now so thinly scattered over the country, that many farmers do not even know its existence.

Pliny writes of it as a fruit held in estima-tion by the Romans. He mentions four sorts, some round, resembling apples, others shaped like pears, others like an egg, and one variety some beautiful specimens of household medicinally. He states, that Cato would have service-berries preserved, grass bonnets in imitation of the Leghorn. (book xv. c. 21.) and in the 17th chapter of the same book he gives directions for preserving them in two different ways: again he mentions them in his 23d book 17th chapter and very support the same book he gives directions for preserving them in two different ways: again he mentions them in his 23d book 17th chapter and very support to the Rev. the positive evidence of qualities, the quantity oows each, of the best quality, New England alone could furnish twenty, which would equal count of her. Capt. Tracy, of the London Packet, them in the quantities of milk, butter and cheese, added a new proof, to the many he has already which they would respectively produce. If this should be true, and I have no doubt of it, we at least possess one of the parents in perfection, from which an improved race might be procured. This opinion is not expressed lightly. We infer its opinion is not expressed lightly. We infer its asking a premium.

In the quantities of our decision as to milch cows, which we count of her. Capt. Tracy, of the London Packet, hope will be satisfactory.

The Committee have endeavoured to give general satisfaction and if they have failed of that, they will at least have the pleasure of having satisfied themselves.

JOHN LOWELL, Chairman.

After so long a trial of the patience of the Company of the Committee of the Massachusetts Society for the committee of the ring our short period of exhibitions, we have had quite as early as they would wishseveral, which have equalled the best, of which any accounts have been published. But we would wish, that it should be distinctly under-star, of Deerfield, weighing 2333 pounds, stood, that we refer only to a small part of our milch cows, and that we fear much the greater number are lamentably poor. We are well con-vinced, that some dairies in our country, with two good cows, produce as much as the average of those which have five. If we are correct, or nearly so, in the opinion above expressed, how does it happen that our breed of cattle on the whole is so inferior? Because the owner of a good cow, instead of putting a proper value upon her, will generally send her to the nearest scrub bull, to save a little labor, and some trifling difference of expense. This we all feel and know to be true. But this shameful negligence is giving place to Salem, more judicious measures, owing principally to the effect of the public shows. If every owner of a Milton, good, and very superior cow, would consider her in a proper light, not merely as a valuable ani-mal during her life, but as capable of improv-ing his whole stock—if he will spare no moderate expense in procuring calves from her, from bulls of an improved breed, we shall soon see our whole stock gradually improve. Bakewell ordinary cows, of five years old, who have consumed twelve tons of hay, including pasturage, and have required great labour in attending on head, or a large frame, or small teats, or, in short, them; when they hear such a fact as this, that an excellent judge offered fifty dollars for a two months calf, of the cow hereinafter mentioned, owned by the Hon. Mr. Gray, they produce more the fire points decounted by the Hon. Mr. Gray, they produce more to the exterior.

for the amelioration and improvement of our own native breeds. They cannot attend one of our shows, without perceiving the *public preference* for the new races, and this is a strong confirmation of the justice of the decisions, though we are aware that it is not the least difficult task of the Committee to endeavor to decide without any bias from this clearly pronounced opinion of all the bystanders.

We have said that the imported stock and their progeny have usually been preferred by the visitors at our shows;—we would make one except-world and purely with the view of giving aid to the show, exhibited fine animals at no small expense and trouble. It is probable that as the Committee took no minutes of these animals, some of them may be overlooked. One we could not forget—the fine imported bull Denton, belonging to Stephen Williams, Esq. of Northborough. He has improved with age, and shows that he has an owner who is sensible of his great value. Nor could any one minum, but the difference of age decided the questoverlook Coelebs, owned by Major Jaques, of these animals. There were fine bulls offered tors at our shows;—we would make one exception, and that is, with respect to milch cows. Although the milch cows of Great Britain and the countries of the ground, those who are fend of of the fine native breed, so often noticed by us,— Netherlands are in general far, infinitely, superior viewing fine natural productions, would feel that and by Mrs. Amory, of the Cœlebs Breed, one of to our own;—yet during the 6 years in which I a visit to Brighton was well repaid by the sight which took a premium last year. There was always had this unpleasant duty to perform, I have and comparison of these animals, differing considerable to a superior Holland Bull, imported by Mr. For-

the Promotion of Agriculture, appointed to decide on all the smaller class of animals including heifers.

REPORT: That twenty-five animals of the class of "heifers, of from one to three years old," were in the \$30 pens for premium or exhibition—all of an exceljent quality, and most of them of approved breeds. \$20 And generally indicating the increasing attention of the agricultural interest to this important class \$30 of stock. The general improvement in this class of animals, compared with our former Cattle

\$20 Shows, was very marked and decided.

The first premium was awarded for a heifer owned by Henry Rice, Esq. of Marlborough.— She was of the breed of "Denton," the celebrat-ed imported bull owned by Stephen Williams, Esq. of Northborough. This heifer was two years \$30 old on the first of February, from a cow of the Princeton breed; her form and figure strongly in-\$20 dicative of her sire. The heifer sucked only 12 For the next best do. to the Hon. John
Welles, of Dorchester,

The second premium for the best Store Pigs, they award to Mr. Aaron Dow, of Brookline, the sum of

The first premium for the best Merino Ram, they award to Gorham Parsons, Esq.

The committee regret to observe that the general specimen of Merino sheep exhibited for premium, were, in their opinion, inferior to those of former years. They feel themselves justified only in awarding a second premium for the best Merino Ewes to Gen. Austin

The second premium for Merino Wethers they award to Francis Amory, Esq.

For Native Wethers there was no competition. Those presented by Mr. Silas Hall, of Phillipston, were very fine animals, and deemed worthy of the first premium, which the committee accordingly award, of

tering cattle; and which he represented as easier, effort to improve the breed of Sheep in Massachuequally effectual, and less dangerous than the or-dinary method. Your committee were not authorized to grant any premium on this account. Nor can they recommend any to be given, without a more satisfactory evidence of the success of the operation and of all the advantages specified .-Should this be the case, at any future time, it will always be in the power, and they doubt not it will be the inclination of the trustees to grant a just reward for this, as well as for any other suc- The first premium for Broadcloths, to James essful improvement in the important operations of agriculture.

Mr. Meriam also presented several spayed lows, for the society's premium for animals of The first premium for Household Cloth, to that description; but they were not accompanied by any statement of the mode of operation and The second premium for do. to Stephen Buttreatment as required by the rules established by rick, of Framingham. the Trustees, and besides, the operations were very recent, and apparently some of them at least, done expressly for the exhibition, and for the The second premium for do. to Jas. Shepherd purpose of offering for the premium. Now in a case of this nature, when a premium is proposed The first premium for Superfine Satinet, to expressly for the purpose of testing the efficacy Daniel Ellis & Son, of Walpole of an important, and in this country, in some rerespects, a new operation, your committee apprehend that no premium ought to be granted, unless by well attested experiments, supported by a lapse of time sufficient to leave no question The second premium for do. to Adolphus Bar-

Mr. John Baker had entered also four spayed The first premium for Linen Cloth, to Anna sows, belonging to Gorham Parsons, Esq. for the premium proposed for the same operation. They were in fine health and completely healed-neither disfigured nor weakened by the operation .-A certificate also accompanied, made by Gorham Parsons, Esq. which will be laid before the Trustees for their consideration, conformable to their proposal, and in case the same shall be consider-ed, or shall be made satisfactory to them, they don, of Milton

To these ought to be added the heifer of Mr. in such case award to Mr. Baker the premium

Samuel Jaques, Esq. also presented for the So ciety's premium, of the improved Leicester breed of long wooled sheep, having a cross of the South down, one Ram and six Ewes. They were bought by him in Pennsylvania, and from thence brought into this State. Although your Committee know that the intention of the Society, in the proposal offered in the terms of that premium was, to encourage the importation of the animals from some foreign kingdom or state; and, that therefore strictly speaking, Col. Jaques would be entitled to no premium on the terms of those proposals; yet your Committee consider the animals are in this State a new and very important race of Sheep, although precisely not of the description proposed, and that Col. Jaques has at considerable expense character of the machinery employed, and the and trouble, introduced them into it. They, quality of the article, afford a hope that duck may therefore recommend that a premium be granted become one of our staple articles.] to him of \$50.

The Hon. Thomas H. Perkins, Esq. also presented for exhibition, a Ram and two Ewes of the long wooled Sheep of the Netherlands, the The committee have therefore recommended a length of whose wool was greatly superior, and liberal gratuity in this case, as there is both stock its fineness but little inferior, if at all, to those of our present breeds. And although it was not \$10 the intention of that distinguished merchant to stand candidate for any premium, his sole purpose being to aid in the improvement of our breed of Sheep, and thereby to encourage the agriculture and manufactures of his native State, yet your Committee apprehending that all exertions of this kind, so honourable to the individual, and \$10 so advantageous to the community, should receive Upon condition that he give evidence according some mark from our Society of its sense of the beto the rules, that they were wholly bred in this nefit conferred on the Commonwealth; they therestate, and raised by the persons exhibiting them. fore recommend that the gold medal of the So A pair of Stags were presented by Mr. Meriam, ciety, of the value of fifty dollars, be presented to of Concord, as a specimen of a new mode of al-

by the present good market. RICHARD SULLIVAN, Committee.

REPORT NO. 4.—INVENTIONS.

The Committee of the Massachusetts Society for the promotion of agriculture to whom were

referred the subject of inventions, report—
That they have had the gratification of inspecting a number of machines connected with the facilitating manufactures and the labours of agriculture, which have been deposited in the society's room, but none coming within the exact terms of their commission, except a Cast Iron Roller, which was duly entered for premium by Aaron Willard, of Boston. This roller is apparently an improvement on the ordinary roller. It consists of two rollers moving upon one axis, and thereby turns easier and makes less ridges. But the owner not being present nor any person in his behalf, the Committee have not been able to make those inquiries which are necessary to enable them to award any premium.

The next machine presented for their examination and entered for premium, was a vertical family spinner, invented by John Brown, of Providence, and presented for premium by J. R. Newell. It is apparently capable of spinning with from six to twelve spindles, and it was stated to your Committee that a girl of fifteen years of age of common capacity is capable of tending it—that the

To Nancy Wheeler, of Worcester, for Fans
manufactured from Feathers
Messrs. Barrett, Tileston & Co. of Staten Island, presented for inspection some very handsome Woollen Table Cloths and Silk Handker-chiefs as specimens of their work in the art of being used in any family, and found to be by experiment capable of facilitating demostic spinning. Printing and Dying. These deserve mention as riment capable of facilitating domestic spinning. highly creditable to the taste and skill of the In their opinion this is the only test of its real manufacturers. The Handkerchiefs exhibited utility. They think it a sufficiently simple and inwere originally striped and cross-barred silks.—

genious machine. But whether it will perform

NO. 5.—WORKING OXEN.

As your Committee consider the machine as cumstances may be considered as proof that they require no encouragement beyond that afforded likely to be very useful, and as Mr. Pope has been of which cannot but be considered as including at great expense and trouble for the purpose of bringing it to Brighton, your committee apprehend that some notice ought to be taken of it, and they therefore recommend that he should have a premium of \$20, he producing the requisite certificates of its being used and approved by a practical farmer.

Mr. Newell also presented for premiuma cornbarrel.

The Committee did not see its power, but apprehend it may be made a useful machine, with the Commonwealth be promoted.

(Signed)

J. WELLES, Chairman. some improvement, but do not consider them-selves authorized in its present state to award a premium.

The same gentleman presented for exhibition a number of excellent and approved English machines, and also some of the invention of this country, among these they notice An English Turnip Cutter.

Three Double Mould Ploughs. Batson's Scarifier. Batson's Cultivator.

Howard's Patent Plough.

Also, an English hay maker, sent from Balti-more. All of them are worthy of the attention

JOSIAH QUINCEY, CYRUS ALGER, PAUL MOODY.

Society for Promoting Agriculture, to decide on the claims for premium for the best Working Oxen, at the Cattle Show at Brighton, Oct. 10, consisting of John Welles, Silas Gates and Elijah Perry, REPORT:

That they were well pleased to find amongst the other distinguished evidences of improvement at their show, an increased number of

Twelve yoke of Working Oxen were entered and appeared to contest for the premiums offered by the Society.

The Cattle were in general in their training more perfect, and the committee feel confident that the community may look forward to the most gratifying results.

After taking into view the strength in reference to their age and size, the equality of match, discrediting the manufacturers, by adverting to the bushels and 12 quarts of oats in one hour-and the docility and training, as well as other general circumstances, the Committee unanimously agreed to award the following premiuns: To Luther Whitney, of Sutton, first pre-

mium \$30 00 To Peter Darling, of Sutton, second pre-To John Sherman, of Sutton, third premium 20 60 To Daniel Marble, of Sutton, half of the

fourth premium To Jonas L. Sibley, of Sutton, the other half of the fourth premium 7 50 To Capt. Joseph Curtis, of Roxbury, the fifth premium 10 00

The Committee were all pleased to see so favourable an illustration of the benefit of the the most essential interests of the state.

To the honour of a small but respectable section of the country it receives a principal part of the premiums of the Society. But it is be-lieved that no man will doubt the distinction is well merited. It is to be hoped that other parts of the state will feel excited to such an exertion as will spread the evidences of our sheller, on a horizontal movement, on a wooden farmers care and skill more equally over the state, and thus the great object of the Society in the advancement of the honour and interest of

No. 6 .- Ploughing Match.

The Committee on the Ploughing Match, consisting of John Prince, Benjamin Goddard, and S. G. Derby, having attended the duty assigned them, beg leave to

REPORT:

That the ground selected for the purpose by the Committee of Arrangements, was a very though green sward of 20 years lay, and had been chiefly used as pasture for fat cattle, was previously laid off in lots of sixteen rods long and one and a quarter rods wide, making one eighth of an acre, (which was less than was wished, but being the only spot convenient that could be procured, could not admit of their being larger)—the soil excellent and free from

stones or trees, and each team had a perfectly 3d premium to Stedman Williams equal chance. The ploughs were duly entered for the contest, and the ploughmen drew for Samuel Prince, driver lots as follows:

No. 1.—Aaron Davis Williams, of Roxbury, one pair of oxen, Lewis Bliss ploughman, David Howe driver—Warren's Dedham plough, with

wheel-17 furrows-23 minutes.

No. 3.—Stedman Williams, of Roxbury, two pair of oxen, Stedman Williams, ploughman, Samuel Prince driver—Warren's of Dedham plough, with wheel-18 furrows-26 minutes 30 seconds.

No. 4.-Joseph Curtis, of Roxbury, two pair oxen, Luke Rollins ploughman, Amos Wyman driver-Warren's Dedham plough, with wheels and cutte: 20 furrows-27 minutes 30 se-

No. 5.—Luther Whiting, of Sutton, two pair oxen, Royal T. Marble ploughman, Luther Whiting driver—Sutton plough, with wheel— 16-furrows-30 minnutes.

No. 6 .- Aaron D. Williams, of Roxbury, one pair oxen, Thomas Howe ploughman and dri--Warren of Dedham plough, with wheel

No. 7.—Silas Dudley, of Sutton two pair oxen, Silas Dudley ploughman, Joseph Dudley driver

cutter-17 furrows-26 minutes.

No. 8 .- Isaac Cook, of Brookline, one pair oxen, Caleb Miller ploughman and driver-Warren of Dedham plough, with wheel and cutter-19 furrows-33 minutes.

No. 9 .- Moses Seaver, of Brighton, one pair oxen, Moses Seaver ploughman, Benjamin Porter driver-Howard of Hingham's plough

with weel—20 furrows—24 minutes. No. 10.—John Sherman, of Sutton, one pair oxen, Asa Cummings ploughman, John Sherman driver-Sutton plough with wheel-18 furrows -22 minutes.

Previous to the ploughing, it was distinctly stated by the committee, that the furrow must be not less than 5½ inches deep, and their greatest wish as little to exceed 10 inches in the width of furrow as was possible, and not to hurry their cattle, as they conceived the best work could not be performed if over driven and that goodness of work, together with that of cattle, would be a great object in deciding premiums, as well as cheapness of labour.

They have great pleasure in stating, that the work was well done, and most of it in a superior style, and that those competitors who failed in obtaining premiums, was because the Committee had it in their power to award only three among ten claimants—indeed, they conceive praise is due to all the ploughmen, who discovered great skill in the management of their implements, and the cattle were universally excellent-and in consequence of the request of the Committee that they should not be hurried, they could generally have proceeded in another one eighth of an acre with ease.

The Committee have been unanimous in their awards after a very critical examination,

as follows:

1st premium to Isaac Cook	\$20
Caleb Miller, ploughman	10
do, do, driver	5-35
2d premium to Joseph Curtis	12
Luke Rollins, ploughman	6
Amos Wyman, driver	3-21

ploughman

Some years ago I undertook to write a new treatise of arithmetic, better adapted to the capacity of the learner and agricultural business than any heretofore published; in the composing of which I did not take any thing for granted, but demonstrated and proved every rule that I laid down.

In gauging I found that all the rules that any authors had laid down were either very erroneous, or required such a tedious calculation with a vast number of figures as to be liable to error, and that their diagonal and gauging rods were at

simple, plain and correct, than any that I could find published, and after nearly despairing of finding any better or more short than the rule laid down by the learned and ingenious James Ferguson, I accidentally hit on the following:

1st. Multiply the mean diameter by itself. 2d. Multiply the product by the length.

3d. Multiply that product by 34.
4th. Strike off four decimal points and you have the true contents in gallons and decimal parts of gallons.

The excellence of this rule is, it avoids the tedious process of any long division, and does not require one fourth part of the number of figures as the shortest rule laid down by James Ferguson, and it is equally correct in casks of any

proportion.

The dimensions should be exactly taken with a scale that has the inches divided into tenths, 28 inches. cask. Bung diameter.

Head do,	20

The true content is 62 gallons and ,6688 decimal parts of another gallon.

I could readily give a demonstration of this theorem on the principles of Euclid, but leave that as an exercise for the students of mathematicks, perhaps if they do not immediately hit on

this theorem, they may some other.

This concise rule makes the small allowance that James Ferguson recommended for the spheroidical figure of casks, and if it deviates, it gives a little too much by the inside of the casks not being geometrically round.

If there is any readier way to find the con-tents of a cask, I believe I have it in a treatise I have written on a new science, that I call Semi new apportionment.

The following is the rate of apportionment, according to which, the Members of the House worm in the autumn, the other escaped.

ties. They may readily measure their grain by with a plain scale of equal parts, and pair of of Representatives for the next Congress are the bushel, and weigh their flax by the pound; dividers, without any calculations by numbers. to be chosen (the present Congress being combut to ascertain the number of their gallons of L carried it so far as to project extracting the posed according to the old ratio.) The whole cider they will find attended with difficulty.

To find the contents of a cask by semi geome-try is a very handsome projection, but the fi-gure cannot be intelligibly described in a newspaper, without a large plate—yet, to such as are well versed in *Euclid* I may render myself in-telligible, for to such if they are expert with a scale and dividers the contents of a cask, without any calculation, may be projected into a parallelogram, of equal contents superficial measure. That for a large cask, would be extensive, and may be reduced, although 231, the cubic inches best but a random way of guessing at the contents of casks of different proportions.

I tried various ways to raise a theorem more parallelogram is projected for 3 inches deep, we and 11 only, then project the reduced parallelo-gram to one of equal content 11 wide, then step have 77 to divide again, that will divide by 7 off the gallons by 7.

Semi geometry is a science that all farmers any kind of farmers or mechanical business.

with whole numbers from the first numeration table, in order to suit the currency of the United States. I taught that there was but simply triol, and one third with only the common the nine numbers in nature, that any thing further than nine was but repetition, according to place in the numeration table. That nine was the Crown Aumber, and would prove any calculation within the four rules in whole numbers, different result.

I had given to me a sample of old Scotch wheet and taught how to prove them, as also if there and the work will stand as follows: Suppose the long division whether in multiplying or subtracting.

for calculating interest for days or broken time, 26th of October last, in the following manner. as the work was too tedious and too much lost in little fractional remainders to be correct. I tried a variety of ways to form some better and bed with smut balls. more exact rule that would not require so many figures—until I discoversed nine proportion-ate Logarithms (and there is no more in nature) that will shew the interest of any broken sum of dollars and cents for any broken time or number of days, or at any rate per cent—and bring out the whole in one sum to the ten thousandth part of of a cent, with less figuring than any other mode, and without any division, which I believe the greatest of my discoveries.

I shewed them at several of the banks that I could calculate interest quicker and more correct than any clerks they had—but they spurned at such instruction. I then tried to sell my copy right to several printers—they would not buy it because they said it was not like Dit-worth's and other treatises. I told them if it was like other treatises there would be no need for them to buy it—and that if people would be such slaves to custom as not to look at any thing new, they never would advance in improve-

At this advanced period of life I believe that my labours for the benefit of the public must die with me, except some few ideas that may be retailed in newspapers

quick lime. 14. Free. Same.

Nearly every grain grew; the wheat looks to-lerably even, and remarkably well, but I am afraid the birds will destroy the corn before harvest, so that I shall not be able to give you an account of the different samples.

It appears from the above, that boiling water and quick lime, as well as blue vitriol, are effectual remedies against smut. But these steeped in vitriol lost most plant in the autumn, and suffered more from enemies than either of the others. I remain, your's, &c.

WINE, GRAPE CUTTINGS, CIDER, &c.

Vineyard, near George Town, D. C. Sept. 17th, 1822.

J. S. SKINNER, Esq.

Dear Sir,—I have just finished making wine from my small Vineyard—I have four-tenths of remained one year in the nursery, and the year formerly placed with us for distribution, a part before last they were planted out where they of which we gave to Gen. Forman, who divided proprietor under his own eye and care, at the next they grew luxuriantly, and this is the first year of their bearing. Sixty-three vines of first year of their bearing. Sixty-three vines of the Constantia have produced eighteen bushels of grapes, in the bunches, which made two quarter casks of wine of 28 gallons each. One hundred and fifty-eight vines of Tokay, &c. produced 47½ bushels of grapes. So that the whole vintage was 65½ bushels, and I find that a bushel of bunches yields about three gallons of juice. My Russian rye, I got of you; it's the first we have designated friends; we fear that the unprece-vines are planted in rows 12 feet apart, and are had of it—it's whiter than the flour of our com-6 feet distant in the rows.

I have from the whole, made seven barrels and six quarter casks of wine. This is the first year of their bearing, and they cover, in all, about one acre of land. I have near four acres more, most of which will bear next year, and I intend

commonly called the Miller Burgundy, or blue 12 cts.—Coal, Virginia, per bushel 25 to 30 cents English grape. I intend offering the cuttings for sale, in the proper season, at the following prices :

One dollar for a single dozen cuttings Five ditto for one hundred Or five hundred for twenty dollars.

Persons who wish to buy, can write to me,

post paid, and they will be attended to.

Will not your respectable, Maryland Agricultural Society offer premiums for the cultivation of Vineyards and Orchards, and the fabrication of Wine and Cider?* I have found the book on Wine Making,† that you were so good as to lend me, exceedingly gratifying and most probably useful to me this summer.

A barrel of Tokay wine, made about two weeks since, has just been examined—I did not put a particle of spirit in it, yet this wine is very strong, and I believe it will have body enough to keep without spirit. Your's, respectfully, JNO. ADLUM.

gingly furnished me with his observations on or claret wine is substituted for the cream. Strawberry jam is much admired; and for ice the culture of this fruit, which furnishes a Strawberry jam is much admired; and for ice the culture of the dayntages of botanical creams the flavour is generally preferred to that knowledge. Mr. Keen states, that the want of creams the flavour is generally preferred to that knowledge. Mr. Keen states, that the want of creams the flavour is generally preferred to that which furnishes a Strawberry jam is much admired; and for ice treams.

The pine strawberries make an agreeable destination of respective to the culture of this fruit, which furnishes a Strawberry jam is much admired; and for ice treams.

The pine strawberries make an agreeable destination of respective to the culture of the cultur STRAWBERRY PLANT.—FRAGARIA.

In Botany, a Genus of the Icosandria Polygynia Class.

This most agreeable fruit does not appear to have been cultivated by the ancients; and it seems only to have grown in the mountainous parts of Greece and Italy, the climate being too plants, which having, processed the fruit being too predominant from berry plants gave out abundance of male blossoms, but produced no fruit. I therefore, in the year 1809, had all these plants taken from my beds, and had other beds made with the first than five monastery of Bathalla, in Portugal, is beds, and had other beds made with the first the tomb of Don John, son of King John the bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing, or female plants only; but from I had bearing or female bearing, or female plants only; but from I had bearing or female bearing, or female plants only; but from I had bearing or female bearing, or female plants only; but from I had bearing or female bearing, or female plants only; but from I had bearing or female bearing or f

warm in the other parts of these countries. It is slightly mentioned by Vinor does not mention men "strawberries do grow upon hills and valleys, seed, Mr. Keen has procured a new variety of vated in England previous to 1633. Miller likewise in woods, and other such places that this fruit, to which he has given the name of states, that he has had it grow upwards of bee something shadowie. They prosper well in Imperial Strawberry; it is of a dark ruby co-three feet high in one summer, and produce gardens: the red strawberry euery where; and lour, and, in appearance, the most beautiful of flowers the same year it was sown; but this the other two, white and green, more rare, and all the strawberries; but I find the flavour of must have been accidental, for none of his older are not to be founde saue onely in gardens."

Shakespeare says: it is not superior to that of other kinds. Mr. plants blossomed, although he had them twelve Keen recommends the month of March, as the feet high, and eighteen years old. There is a best season for making new beds.

"The strawberry grows underneath the nettle:

And wholesome berries thrive, and ripen best, Neighbour'd by fruit of baser quality."

The scarlet strawberry is a native of Virginia.

best season for making new beds.

The strawberry is our earliest fruit, and, as few years back for the first time.

The scarlet strawberry is a native of Virginia.

The scarlet strawberry is a native of Virginia, where it grows wild; and was brought to this country in 1629. It is the earliest sort, and is the best strawberry for forcing.

The hautboy-strawberry was procured also from America; from which we have raised the improved kind, called the globe-hautboy.

The Chili strawberry takes it's name from that part of America so called, from whence it was brought by M. Frazier, engineer to the French king. It was cultivated in the royal gardens at Paris, from whence some of the plants were conveyed to Holland, and from the latter place they were brought to England, by Mr. Miller, in the first year of the reign of King George the Second, 1727.

The Alpine strawberry is a native of Gertage and the cold custom of putting clean straw round strawberry plants, is still continusted in some parts of Suffolk. The late Sir J. Banks concludes, that their English name was derived from the practice of putting straw under them when the fruit began to swell, as the plant has no relation to straw in any other shape to the name of the berry, or to the plant. Sir Joseph adds, although the custom of putting straw ound strawberry plants, is still continusted in some parts of Suffolk. The late Sir J. Banks concludes, that their English name was derived from the practice of putting straw under them when the fruit began to swell, as the plant has no relation to straw in any other shape to the name of the berry, or to the plant. Sir Joseph adds, although the custom of putting straw under them when the fruit page and the end: they are ovate-oblong, sixteen or eighteen pairs of leaflets, without a sixteen or eighte

In Common Council, Oct. 28, 1822, Read, approved and directed to be published. JACOB MORTON, CIL.

DESCRIPTION OF THE TREAD MILL, Recommended by the Society for the Improvement of Prison Discipline.

The attention of the Society for the Improvement of Prison Discipline has long been devoted to the adoption of some plan for the effectual em-ployment of prisoners. All attempts of this na-ture have heretofore been attended with considerable difficulty, but it is confidently anticipated that this invention will not only afford suitable employment, but act as a species of preventive punishment. Although but very recently introduced into practice, the effects of its discipline have in every instance proved highly useful in decreasing the number of commitments; as many prisoners have been known to declare that they would sooner undergo any species of fatigue, or suffer any deprivation, than return to the house of

correction, when once released.

The annexed engraving exhibits a party of prisoners in the act of working one of the tread wheels of the Discipline Mill, invented by Mr. Cubitt, of Ipswich, and recently erected at the House of Correction for the county of Surrey, situated at Brixton. The view is taken from a corner of one of the ten airing yards of the prison, all of which radiate from the Governor's house in the centre, so that from the window of his room he commands a complete view into all the yards. A building behind the tread wheel shed is the mill house, containing the necessary machinery for grinding corn and dressing the flour, also rooms for storing it, &c. On the right side of this building a pipe passes up to the roof, on which is a large cast iron reservoir, capable of holding some thousand gallons of water, for the use of the prison. This reservoir is filled by means of forcing pump machinery below, con-nected with the principal axis which works the machinery of the mill; this axis or shaft passes under the pavement of the several yards, and working by means of universal joints, at every turn communicates with the tread wheel of each

The wheel, which is represented in the centre of the engraving, is exactly similar to a common | same degree of hard labour.

water-wheel; the tread-boards upon its circumference are, however, of considerable length, so as to allow sufficient standing room for a row of from ten to twenty persons upon the wheel.*—
Their weight, the first moving power of the machine, produces the greatest effect when applied upon the circumference of the wheel at or near the level of its axle; to secure, therefore, this mechanical advantage, a screen of boards is fixed up in an inclined position above the wheel, in order to prevent the prisoners from climbing or stepping up higher than the level required. hand-rail is seen fixed upon this screen, by holding which they retain their upright position upon the revolving wheel; the nearest side of which is exposed to view in the plate, in order to represent its cylindrical form much more distinctly than could otherwise have been done. In the original, however, both sides are closely boarded up, so that the prisoners have no access to the interior of the wheel, and all risk of injury whatever is prevented.

By means of steps, the gang of prisoners ascend at one end, and when the requisite number range themselves upon the wheel, it commences its revolution. The effort, then, to every individual, is simply that of ascending an endless flight of steps, their combined weight acting upon every successive stepping-board, precisely as a stream of water upon the float boards of a water-wheel.

During this operation, each prisoner gradually advances from the end at which he mounted towards the opposite end of the wheel, from the last man, and having taken his turn, descends for rest

* The wheels erected at the House of Correction at Coldbath-fields, are each capable of containing forty or more prisoners, and the joint force of the prisoners is expended in giving motion to a regulating fly, which, by exhanding itself in proper-cost may, in some instances appear heavy, the tion to the power, will keep any number of men, subsequent advantage from their adoption, in from twenty to three hundred and twenty, at the point of economy, is by no means inconsiderable,

(see plate) another prisoner immediately mount ing as before to fill up the number required, without stopping the machine. The interval of rest may then be portioned to each man by regulating the number of those required to work the wheel with the whole number of the gang ;-thus if twenty out of twenty-four are obliged to be upon the wheel, it will give to each man intervals of rest amounting to twelve minutes in every hour of labour. Again, by varying the number of men upon the wheel, or the work inside the mill, so as to increase or diminish its velocity, the degree of hard labour or exercise to the prisoner may also be regulated. At Brixton, the diameter of the wheel being five feet; and revolving twice in a minute, the space stepped over by each man

is 2193 feet, or 731 yards per hour. To provide regular and suitable employment for prisoners sentenced to hard labor, has been attended with considerable difficulty in many parts of the kingdom; the invention of the Discipline Mill has removed the difficulty, and it is confidently hoped, that as its advantages and effects become better known, the introduction of the mill will be universal in Houses of Correction. As a species of prison labour it is remarkable for its simplicity. It requires no previous instruction; no taskmaster is necessary to watch over the work of the prisoners; neither are materials or instruments put into their hands that are liable to waste or misapplication, or subject to wear and tear; the internal machinery of the mill, being inaccessible to the prisoners, is placed under the management of skilful and proper persons, one or two at most being required to attend a process which keeps in steady and constant employment from ten to two hundred or more prisoners at one and the same time, which can be suspended and renewed as often as the regu-lations of the prison render it necessary, and which imposes equality of labor on every individual employed, no one upon the wheel being a-

ble, in the least degree to avoid his proportion. The arrangement of the wheels in the yards radiating from the Governor's central residence. places the prisoners thus employed under very good inspection, an object known to be of the utmost importance in prison management. At the Brixton House of Correction, with the exception of the very few confined by the casualties of sickness or debility, all the prisoners are steadily employed under the eye of the Governor during a

considerable part of the day.

The classification, also, of the prisoners, according to offences, &c. may be adhered to in the adoption of these discipline wheels; the same wheel or the same connected shafts can be easi ly made to pass into distinct compartments, in which the several classes may work in separate parties. In the prison from which the annexed drawing is taken, a tread-wheel is erected in each of the six yards, by which the inconve-nience and risk of removing a set of prisoners from one part of the prison to another is obviated.

As the mechanism of these Tread Mills is not of a complicated nature, the regular employ-ment they afford is not likely to be frequently suspended for want of repairs to the machinery; and should the supply of corn, &c. at any time fall off, it is not necessary that the labour of the prisoner should be suspended, nor can they be aware of the circumstance; the supply of hard labour may therefore be considered as almost un-

With regard to the expense of these machines, it may be observed, that although their original and it is derived in a manner which must be most

establishments, viz. from the diminution in the ty in the character of the English yeomanry, pect it, it is too much like blowing hot and blow-number of persons committed. Such have been and perhaps I may say nation, that renders their ing cold with the same breath. number of persons committed. Such have been and perhaps I may say nation, that renders their ing cold with the same breath.

The results already experienced at those prisons endeavours in almost every undertaking, ultimately successful, and their farming stock of albreed in England, unless the North Devonshire forced. The saving to the county (in consequence of the reduction in the number of criminals) in the public charges for their apprehension, committal, conviction and maintenance,

cannot but be considerable.

Stepping Mill presents as a species of preventive hunishment. Although but very recently introduc ed, and hitherto but sparingly brought into action, the effects of its discipline have in every instance proved eminently useful in decreasing the number of commitments. As a corrective punishment, the discipline of the Stepping Mill has had a most salutary effect upon the prisoners, and is not likely to be easily forgotten; while it is an occupation which by no means interferes with, nor is calculated to lessen the value of, those branches of prison regulation which pro-vide for the moral and religious improvement of the criminal.

By a contrivance of machinery which we can-

not here illustrate by a plate,

wheels cease to keep up with the requisite speed to the loin; when fat, very broad, and particularin the mill work, the balls will descend, and a ly full at the sides, the shoulders fitting it equalprojecting pin on the box, striking the handle, ly nice as in the blood horse, without any pro-placed in the proper situation for that purpose, jection of the elbow-ribs, not hanging from, but will continue to ring the bell till they go on again properly; and, by this means, a certain check will be kept on the labourers, and the govinches higher than the back bone, which was ernor or task master apprised, even at a distance, that the full work is not performed.

FOR THE AMERICAN FARMER. CATTLE-Description of the HEREFORD, &c.

TO THE HON. HENRY CLAY.

REMARKS ON THE COMMUNICATION SIGNED GIDEON DAVIS. But the following, we venture to say, will match any thing that has been noticed this season—the truth of which is beyond question:—Mr. Thomas Davis, of this town, raised in his garden a blood twenty hich measured thirty inches in length—POUNDS and fourteen our weighed SIXTEEN more in his garden which he thinks may not exceed this.—Salem Paper.

Easy method of breaking Glass in any required direction.—Dip a piece of worsted thread in spirits of turpentine, wrap it round the glass in the direction that you require it to be broken, and then set fire to the thread, or apply a red hot wire round the glass, and if it does not immediately crack, throw cold water on it while the wire remains hot. By this means glass that is broken may often be fashioned, and rendered useful for a variety of purposes.

-0-From the New Monthly Magazine. THE MILK-MAID AND THE BANKER.

A Milk-Maid with a very pretty face, Who lived at Acton,

Had a black Cow, the ugliest in the place, A crooked-back'd one, A beast as dangerous too, as she was frightful,

Vicious and spiteful. And so confirmed a truant, that she bounded Over the hedges daily, and got pounded.

Twas all in vain to tie her with a tether, For then both cord and cow elop'd together. Arm'd with an oaken bough (what folly!

It should have been of birch, or thorn, or holly,) Patty one day was driving home the beast, Which had as usual slipp'd its anchor, When on the road she met a certain banker, Who stopp'd to give his eyes a feast

By gazing on her features, crimson'd high By a long cow-chase in July.

"Are you from Acton, pretty lass?" he cried:
"Yes," with a curtsey, she replied,
"Why then you know the laundress, Sally
Wrench?"

" She is my cousin, sir, and next door neighbour."

"That's lucky, I've a message for the wench, "Which needs despatch, and you may save my labour,

"Give her this kiss, my dear, and say I sent it, "But mind, you owe me one—I've only lent it."

"She shall know," cried the girl, as she bran-dish'd her bough,
"Of the loving intentions you bore me,
"But as to the kiss, as there's haste, you'll al-

low

"For she, at the rate she is scampering now, "Will reach Acton some minutes before me."

THE FARMER'S CREED.

Let this be held the Farmer's creed, For stock, seek out the choicest breed; In peace and plenty let them feed; Your land sow with the best of seed; Let it not dung nor dressing need; Inclose, plough, reap with care and speed, And you will soon be rich indeed.

Editorial Correspondence.

to do an act of justice, it appears that while their own, whilst they contribute to their country. Davis was zealous to counteract the effects of alleged mistakes, in the highly respectable committee on implements, ploughing, &c. so far as committee on implements, ploughing, &c. so far as they concerned himself, he was regardless of what might be the injurious consequences, to others, of his own mistakes; as I wish to be as concise as possible, I shall pass over several of his mistatements, as the influence of most of them is destroyed by the able reply of Com. Porter. He, however, has made himself responsible for one capital mistake, in his assertion, that my ploughshare and coulter were laid with steel. I have it fully in my power to prove, that there was not a particle of steel on either, and how he "could make this mistake, is for him to say, or others to judge, and not for me—for I don't know." As to their being "ground smooth," the plough had been tried in hard and gravelly ground, (a situation in which Mr. Davis, I presume, is not fond of exhibiting his ploughs)—when they had been battered and gapped, it was thought less expensive to grind them than to send them to the blacksmith's. Now, Sir, if you please, one word as to fashion, though I am quite surprised, that he should so far deviate from the regimen of his society, as to become a stickler for fashion! "Tis true my plough is old fashioned; and to its credit, be it spoken, it has withstood the test of long tried experiment, in a neighbourhood too, where almost every new."

DEAR SIR,

If there should be any application to you for Dishley sheep, I should be obliged by your bear, others should be obliged by your bear, and they sheep, I should be obliged by your bear, and the should be obliged by your bear, and they sheep, I should be obliged by your bear, and they sheep, I should be obliged by your bear, and they sheep, I should be obliged by your bear, and they sheep, I should be obliged by your bear, and they sheep, I should be obliged by your bear, and I think I have ever seen; and I would like to dispose of them. My friend, Mr. Louis Cla.

Mr. Clapier has also just presented me with a pair of Cape-sheep, which resemble the Barbary or Tunisian sheep, but I do not think them so good; th they concerned himself, he was regardless of what withstood the test of long tried experiment, in a neighbourhood too, where almost every new fashioned filough has been tried, and thrown a- Extract to the Editor, dated Wilkesbarre, Pa. 9th side, as not answering the purpose of the practical farmer; were the question asked, where are the numerous ploughs introduced here from Journal, notice is taken of a Threshing Machine, Pennsylvania, Virginia, and elsewhere? the invented by a Mr. Pope, of Hallowell, in Maine, wooden stocked, the all iron, and for aught I and another still more efficient by a Mr. Seth know, half a dozen other fashions of this same Ballow, of Livermore. As I am desirous of learn-Mr. Davis, attempted by newspaper puffs, and ing full particulars of both these machines, I otherwise, to be brought into general use? I say if this question was asked, in a district of coun-formation as you may possess concerning them, try which can beast of more good ploughing, per-so as to enable me to obtain the neccessary partitry which can beast of more good ploughing, per-so as to enable me to obtain the neccessary parti-haps than any other of equal extent in the mid-culars by application through the proper chandle states, the answer would be among the useless leads of the farmer! In conclusion, when the merits of my ploughs fail to recommend them, without the aid of detracting from the just merits of others, Gideon Davis, and all others, may save themselves the trouble of all unfair attempts to condemn them, as I shall willingly adopt a better fashion, or turn my hand to some other which we do by the following letter and certifi-

Edit. Am. Farm.

Oak Hill, Sep. 20th, 1822.

J. S. SKINNER, Esq.

DEAR SIR,

Permit me, Sir, to mention a threshing machine, which was invented by Seth Ballow, of Maine, and lately brought here by two gentlemen of the state of Maine.

"Copy of a certificate obtained upon the ma-

chine being viewed in operation.

and better adapted to the purpose of Farmers straw more effectually than even the ordinary mode of threshing.

J. Bayley, W. Ellgey, Ariss Buckner, Charles Lewis, Robert Bayley, Samuel Halley,

W. Beveridge, Jacob Ish, R. H. Little, Geo. B. Whiting, W. J. Weldon, Edmund Tyler, Francis Strebling.

A thorough conviction that this machine will be of great importance to the agricultural interest of our country, induces me to trouble you upon the subject. My impression is that, the machine is fully competent to thresh 100 bushels per day, with three hands and one horse, and may be enlarged so as to do 150 bushels per day, with great ease to two horses and four hands.

I remain sir, With sentiments of respect, &c. WILLIAM BENTON. President Monroe's Farm, Loudoun County Va. }

TO THE EDITOR OF THE AMERICAN FARMER.

Snowhill, August 20th, 1822.

It grows from four to six feet long, and is nearly of one size, from one end to the other. I wish you would make inquiry through your paper, if there is any like it in the United States, as there is none, as far as I can learn, in this county; nor any where that I have travelled. I think you will see that I have travelled. I think you will see that it is capable of being worked into Hats or Bonnets, which it has been in this neighbourhood, and the durability is equal to any neighbourhood, and the durability is equal to any Leghorn. This grass has no joint; it falls on the ground and attaches itself in the manner of a vine, at every 3, 4, 5, or 6 feet. I think I could save a ton annually. I will send a sample to the proprietor of any Boynet Feetown that round in this limit justified by the proprietor of any Boynet Feetown that round in this limit justified in the record list of antients over a territory of one hundred miles square, a surface considerably larger than the whole ground and attaches itself in the manner of a surface considerably larger than the whole assured to the larger than the surface considerably larger than the whole assured to the larger than the whole as the surface considerably larger than the whole assured to the larger than the whole as the surface considerably larger than the surface considerably larg proprietor of any Bonnet Factory that may request it. Your attention will be acknowledged by your humble servant, THOS. R. P. SPENCE.

We have received the specimen and finding it JOHN S. SKINNER, Esq. very brittle, we should have feared that, it could Dear Sir—"The farmers in this county have not be usefully employed in manufactures; if taken the fodder from their corn, and can now our very respectable friend had not stated the judge more particularly and exactly what they fact, that Bonnets and Hats made thereof, had will make—and after all our fears about the

ARBORICULTURE.

THE FRUIT OF THE LOTUS-TREE OF THE ANCIENTS.

Has been made so interesting to us, by the inimitable pens of Homer and Ovid, as well as the mention made of it by Herodotus, Strabo, Pliny, and other authors of antiquity, that I am induced to give their accounts of this celebra-ted fruit; although it is now either entirely lost, or so much degenerated, as not to be known by their descriptions.

Some authors suppose it to have been a fabu-

vered under some other appellation, we may still expect that our researches in the interior of Africa will restore the lost treasure. It is now about 2700 years since Homer related the enchanting effects this fruit had on the followers of Ulysses:

Nine days our fleet th' uncertain tempest bore, Far in wide ocean, and from sight of shore; The tenth we touch'd, by various errors tost, The land of Lotus and the flowery coast. We climb'd the beach, and springs of water found.

Then spread our hasty banquet on the ground. Three men were sent, deputed from the crew, (An herald one) the dubious coast to view, And learn what habitants possess the place. They went, and found a hospitable race; Not prone to ill, nor strange to foreign guest. They eat, they drink, and nature gives the feast; The trees around them all their fruit produce, Lotos the name, divine, nectareous juice! (Thence called Lotophagi,) which whoso tastes, Insatiate riots in the sweet repasts, Nor other home, nor other care intends, But quits his house, his country, and his friends: The three we sent from off th' enchanting ground We dragg'd reluctant, and by force we bound; The rest in haste forsook the pleasing shore, Or, the charm tasted, had return'd no more Hom. Odyss.

to

From Ovid's elegant fable of Dryope, we learn from whence this tree is supposed to have derived its name.

Not distant far a wat'ry lotus grows; The spring was new, and all the verdant boughs, Adorn'd with blossoms, promis'd fruits that vie, In glowing colours with the Tyrian dye.

capes there are islands near to the main land. her name Lucina, which was about 450 years It is thought, continues he, that Menynx was back, and doubtless this tree is so old."

the country of the Lotophagi, or those that feed on the lotus-trees, of which country Homer makes mention; and there are certain monuments seen, and Ulysses's altar, as well as abundance of lote-trees, the fruit of which is exceedingly sweet.

"Another lote-tree there is," says he, "still older, but the age of it is likewise uncertain: it is known by the name of Capillata (hairy,) and so called, because the hair of the vestal virgins' heads is usually brought thither to be consecrated. There is a third lotus at Rome, in

Pliny has furnished us with an account of the the court-yard and cloister about the temple lotus-tree, in his 13th book, c. 17. According of Vulcan, which Romulus built for a perpetuto this author, the finest trees of this kind grew al monument and memorial of a victory, and on two large sand banks on the Mediterranean defrayed the charge out of the tenth of the pil-Some authors suppose it to have been a ladulous fruit, and only to be found in the poet's imagination. This idea is absurd. Ovid has described it as particularly, or more so, than any other fruit mentioned in his Metamorphoses.

The Lotus-tree was evidently a native of The Lotus-tree was evidently and the Lotus-tree was ev The Lotus-tree was evidently a native of Africa; and in all probability was improved, by being cultivated on the sands of the coast, where, not being indigenous, it has been lost from the neglect of the inhabitants, during the revolutions which that part of the world has undergone. If this fruit has not already been discovered under some other appellation, we may verieties of the liex or holm-tree. I here countrymen called it the Greek bean. He says the fruit is sweet, but that nothing is more bitter the fruit is sweet, but that nothing is more bitter the generality of them as being the size of a bean, and of the colour of saffron, yet, says he, before it is quite ripe the fruit changes into a variety of colours like grapes. It grows thick among it abounds in all parts of the interior of Africa. Agreeable to his account, it is rather a thorny the branches of the tree, in the manner of myrster and not, says he, like cherries. This strubt han a tree. The fruit is a small farination of the colour of saffron, yet, says he, before it is quite ripe the fruit changes into a variety of colours like grapes. It grows thick among it abounds in all parts of the interior of Africa. Agreeable to his account, it is rather a thorny the branches of the tree, in the manner of myrster and the part of the colour of saffron, yet, says he, before it is quite ripe the fruit changes into a variety of colours like grapes. It grows thick among it abounds in all parts of the interior of Africa. Agreeable to his account, it is rather a thorny which being pounded and dried in the says are like those of the end of the colour of saffron, yet, says he, before it is quite ripe the fruit changes into a variety of colours like grapes. It grows thick among it abounds in all parts of the interior of Africa. fruit in Africa, continues Pliny, is so sweet and ceus berry, which being pounded and dried in pleasant, that it has given the name both to a the sun, is made into excellent cakes, resembnation and country, as the people are called Lo-ling in flavour and colour the sweetest ginger-tophagi; and so welcome are all strangers there, and so well contented with their entertainment, quor is obtained from the lotus, which, we may they have for this fruit, when once they have ta-ken to it. By report, (adds this author,) those who eat of it, are free from all diseases of the lass long been cultivated in this country: as stomach.

> had no kernels within; for there is a kind, says ly, where there is found store thereof, as Ma-Pliny, that has a kernel as hard as a bone, thiolus testifieth; I have," says he, "a small From this fruit was pressed a wine similar to tree in my garden: there is likewise a tree theremead, which he states, on the authority of Nepos, would not keep above ten days. The Lotobelonging to M. Gray, an apothecary of London,

> The wood of the lotus-tree, according to the that the truit ripens in September: the berries, account of Pliny, was of a black colour, and was, he says, are round, and hang on stalks like chersays he, much sought after for making musical ries, and not like the African lotus. "They pipes. Shafts of daggers and knives, &c. were made of the roots. This author says, "it is growing in Italy, but with the change of soil it ripe they be somewhat blacke."
>
> The lotus-flower, that is now become so fash-inomable in ornamenting furniture, from the circumstance of it's having been selected as the court-vards. about the finest houses in the court-yards, because the boughs spread so large. Although the body is short and small, it affords much shade; made for his Majesty's Pavilion at Brighton, is yet there is not a tree that gives shade for so not the blossom of the lotus-tree, but of the short a time, as the leaves fall at the approach of winter, when it admits the sun." The bark of winter, when it admits the sun." The bark of water-lily is called Nymphæa, from it's

season for grafting was so near at hand, that I then threw them together too hastily to be sufas late, and it is only such trees as put out early, wounding the wood under it.

and such as grow late, that can be budded in the extremes of the season. Some little errors of punctuation, the reader will readily enough correct; I will only suggest the correction of one, in No. 1, page 7, first column, 13 lines from the top, move the period which closes the sentence at the word "wood," and place it after the perpendicu-lar cut I. This cut, which is intended to unite the two preceding horizontal cuts _ thus I, the reader might take for the pronoun I.* About half way of the same column, a word is inserted, which conveys a different meaning to the one I intended : read until Mr. Andrew Knight recom-mended, instead of "recommenced." After referring to my notes, I cannot discover that I have proved the disagreement between the Apple and Quince, I must have asserted this inadvertently upon the authority of others. But I think I have sufficiently tried the Apple and Pear above ground, without success; and any thing that will only succeed under ground, as Miller rightly observes, is no stock at all. With respect to the Pear Stock improving the fruit of the Apple, I have no experience, but it is contrary to the authority of Mr. Cox, who has written a very useful book on fruit trees. This celebrated orchardist states, that the pear will graft to the apple under ground, but they are evidently deteriorated, except a few

kinds, which will do tolerably well.

I omitted to mention the method I prefer for the preservation of twigs for late grafting. I graft them at the usual time to a different genus, the sycamore is very convenient; this will insure the only fruits I have attempted to preserve on nursery when of the size of a broom-straw, and live an antediluvian age. I transplanted in March

andria. This is the third year that some of them have borne. The fruit I found equal to any of the table grapes of Europe, of those species, and the vines are perfectly healthy. Encouraged by this success, I was induced to procure a collection of vines from Germany, considers a collection of vines from Germany, considers as the elimate somewhat congenial to our own; of others to prove their contrary assertions, in make my horizontal cuts firecisely as wide afact, the same way. But candor compels me to achief I always ascertain by measurement; then and by the aid of the Baron de Ledwer, Consul general from Austria, I received the last
knowledge, that although my notes had been prespring twenty eight species of the hardiest grapes
pared some time before I sent my communication,
I unite their two left hand ends with a perpenselected by the superintendent of the Imperial
yet I neglected putting them into form, until the

FOR THE AMERICAN FARMER.

EARLY SEEDING PREFERABLE TO LATE.

It is a very prevalent opinion in the section of

To insure success, the twigs should be taken of, and several years particular attention to this farmer has the more chances of obtaining a crop from a tree which has ceased growing; bearing very valuable, but with us, precarious crop, I of grain. The 2d conclusion is, that the farmer trees by September are generally in a fit state, have settled down in opinion, that early sowing is in sowing his wheat late, is almost certain to and be inserted on stocks, which are yet growing. Small stocks in rich cultivated ground, will grow pear in the following statement.—I do not intill frost and even later. Those who practice grafting at any season, will avoid much vexation, on the genus, habits, &c. of the Hessian Fly; but from having their grafts blown off; if they would be the graft as near as pearing at any season, will avoid much vexation, on the genus, habits, &c. of the Hessian Fly; but sailed by the fly, whereas the latest sowed crop have it injured more or less by rust, blight, &c. and is not always shielded from the attacks of the fly. For it will be observed, that my crop sowers as from having their grafts blown off; if they would be the graft as near as pearing the graft as near as pearing to the correct description. be careful to have the graft as near as possible ridiculous opinion, of the egg of this insect being but one, was totally destroyed by that insect, and of the size of the stock, and fit both sides with deposited in the grain. Any person who has tolerable precision; each side will thereby unite taken the most superficial view of its habits, with equal firmness, becoming as solid as any must be convinced to the contrary—it shews no part of the stock; and of course preclude every disposition to feed on farinaceous matter, but

future danger of breaking off at the juncture.

At what time the season of summer pruning of trees, is to be limited, I have not determined. I 29th of October and the 7th of December, which

live.

I also at the same time, no three stocks of the been heavily manured; from which two acres, al-

of the present year, some wild plum-stocks, from same kind, treated in the same manner, budded though a great many maggots were to be found in

tween 15th September and 19th October; scarcely any fly was to be seen in the fall; none in the spring; made average crop of 13 bushels to one of seed.

In 1820, sowed between October the 20th and November the 23d, in wet land altogether; some slight indication of fly in April. On the 7th day of June the most promising crop I ever saw.— From 8th of June to 15th, very hot and foggy; crop totally destroyed by rust; averaged 24 bushels of withered grain for one of seed.

In 1821, sowed between October 21st and November 30th; weather cold in December; wheat late in coming up; nearly half killed by cold weather, there not being snow enough all winter to cover it; spring uncommonly favourable; no appearance of fly; grain very good in quality; average crop 3 bushels to one of seed.

In 1822, finished sowing on the 18th day of Oct.; on the 20th, weather being as warm as June, discovered a great quantity of fly moving on the surface; on the 30th of October discovered a good deal of fly in the maggot state in all the without allowing it access to the wound, which Virginia where I reside, that it is necessary to wheat, except where the land has been heavily

I draw from this statement, several conclutwine will answer perfectly well, if they be removed in eight or ten days, which is sufficiently long for them to remain in this climate. I this climate. I this climate. I this climate. I the setting in of the winter's frosts, that it is proper always to sow wheat as early in the fall as possible, that it may estable the several calamities to which it is subhave been very successful with my persimmon nity of depositing its egg in the stalk. It is true jected from being too late in ripening in the sumbuds this summer; and I am not certain but the by pursuing this course, we measurably prevent mer, as well as to give it time to recover from success of all difficult trees depends more on the calamity in the fall, but permit me to ask, if the fall attacks of the fly; for I have discovered, expertness of the operator in applying them, we do not at the same time, subject our crops to in examining this plant minutely, wherever the than on the subsequent waxing. I have also bud- other calamities almost, if not quite as destructive main stalk is much injured by the presence of d many dozens of the mulberry, both white and as the one we are attempting to avoid?

black, without waxing them, with fully as good success as any other tree. I have this season hilated by the winter's frosts, and the necessary it, independent of its original branches; and the made further trials on fall grafting; I inserted my grafts in September and October, with quite as much success as spring grafts; they are now blight, &c. more time these shoots can have to reach the bled to withstand the winter's frosts. It is true After ten years experience, in the cultivation they may also be attacked in the spring, but the crop, escaped the fly entirely, and was the most abundant crop I ever made.

A third conclusion is, that lands heavily manured with good compost, and well pulverised, immediately before the crop is put in, will invariably escape from damage, though they may not from the attacks of the fly; and this last inference has led me to suspect, that, so far from its having been imported into our country as some suppose, it is an indigenous insect, and has become a formidable enemy to our grain crops, in consequence of the inability of our im-

RECEIPT FOR PICKLING BEEF!

October, 1822.

DEAR SIR,-You have published a number of excellent receipts for curing beef, but as none of them contain the alkaline ingredient, on which the high fame of my grandmother's pickle has safely rested for the last half century, and which is believed to make it superior to any other, I send you the whole recipe, as worthy of preservation n your valuable journal, and of general adoption. Several writers have asserted that boiling the pickle will harden the meat; I must, from ex-perience, dissent from this opinion. Boiling and thus purifying the salt and water, will certainly make a pickle that will bear warm weather better than pickle which has not been boiled-and

been improperly ascribed to this practice. When- ate, U. S. Cotton is higher by 1d. a 5-8d. per lb. justly attributable to the boiling.

Your Obedient Servant, SWEET PICKLE.

MY GRANDMOTHER'S PICKLE.

The Beef, as soon as the butcher has finished dressing it, should be hung in a cool place, and become thoroughly cool to the marrow—then cut it up, and cleanse every piece, of blood, &c. in pure cold water; then let the pieces intended for hung beef, the briskets, &c. be lightly rubbed with blown salt, and laid in a pickle tub, that has been nicely cleansed; on these lay the rest, the thickest pieces first, till all, to be pickled, are snugly packed in. If the weather will permit

THE FARMER.

BALTIMORE, FRIDAY, NOVEMBER 15, 1822.

IMPROVEMENT OF NEAT CATTLE-Pedigrees of imported animals, &c. &c.

We have witnessed with peculiar pleasure, the proved fine, and but little good; such would sell Jno. H. Powell, of Philadelphia, continues to manifest for the improvement of our breeds of Neat Cattle; as well by judicious selections from our native stock, as by the importation of chosen

animals from England.

In No. 6, of this Vol. page 48, we published a list of animals, which he had collected chiefly from the Eastern States, for the purpose of exto remain 24 hours in the pickle tub, before the pickle is poured on it.

Take 12 or 14 gallons of pure water (if not pure, make it so, by boiling well after the salt has been put in, and taking off the scum as it rises) and stir in good blown salt till it produces a brine, that will bear an egg well. The day before the sait and water are put together, put on a pot of pure water, into which put clean wood ashes, and boil till they produce a good ley, that feels a little slippery between the thumb and finger; put stantly and generously relinquished by him, for the benefit of the Society.

In the same number, the effects of this gentleman's judicious and spirited efforts, to advance the interests of his neighbours, may be traced through the list of premiums obtained by them for superior young Neat Cattle, that partook of the blood of the improved breed, which he had brought to their notice and placed at their ser-

MARYLAND CATTLE SHOW, NO. 3.

The Agricultural Exhibition held last week, at Easton, in Talbot County, of this State, agreeably to previous notice, was highly creditable in all particulars, to the Farmers; and also, to their honour be it spoken, to the Farmer's wives in that section of the state. An account of what transpired, sufficiently detailed and accurate for general purposes, has already appeared in the newspapers; and we should be content to adopt it, were it not incumbent upon us to record, for future reference, the Official Reports, which will, without doubt, be soon prepared for publi-

It was a matter of regret that a greater number of Farmers was not present, from this shore; but we can assure them that the loss was their's, for every thing seemed to conspire, to entertain and gratify those who went. To most of them the face of the country was new and singular; the season of itself was delightful, and the Practical Farmers attending very numerous, and of the highest respectability. The exhibition was highly promising in every department; the samples of butter exquisitely nice in appearance and quality, the specimens of Domestic Manufactures. properly so called, varied and beautiful of their kind, and the several species of live stock, collected with little time for preparation, fully justified all reasonable expectation.

To gentlemen in attendance from a distance, the hospitality of Talbot, was extended with characteristic bounteousness and elegance, and the only mortification experienced was from the want of time to enjoy it more extensively. Whilst some of us yielded to previous engagements, to visit the hospitable mansions of the Goldsboroughs, the Hammonds, the Tilghmans, &c. others embraced this opportunity of seeing the celebrated Wye House Estate—the splendid property of Col. Lloyd, of the U.S. Senate, who had the rare satisfaction to entertain in the country, three other eminent members of that body, with a numerous company of friends and respectable guests from different states.

We shall here anticipate the official account of the proceedings of the Society, so far only as to state that, James Howard, Esq. was unani-mously elected secretary for this Shore, in place of his much lamented brother, the late Gen. John E. Howard, Jr.

ces have not varied for several weeks past.

W. PECHIN,

With a feeling in which pleasure and pride are blended, acknowledges the receipt of a number of orders from his friends for supplies of his MALT BRANDY, in anticipation of the means now adopted, to furnish the public with an ex tended chance of testing the quality of this liquor. He assures those who have thus confided in his recommendation, who have not been furnished, they shall not be disappointed.

For the accommodation of such as have been more cantious, wishing to "taste and try," the MALT BRANDY is now for sale in different convenient sections of the city, by the following persons, proprietors of public houses and liquor stores, viz. Messrs. Richard Denovan, W. J. Alcock, Lexington street-A. Hussey, Howard st .-W. M'Clean, Cugle, T. A. Norris, Barnum J. Wilson, Ross, Baltimore st.—G. W. & H. Miller, Chapman, M'Kenley, opposite Marsh Market, Jas. C. Maguaran, Court-House Hotel—Williamson, Fountain Inn—Sinners' Hotel, Water st. —Escaville, Exchange Coffee House—J. Hanna, Light street wharf—M'Keldin, Pratt street—J. Ramsay, B. Wilson, James M'Donnell, Keller's Hotel, Fell's Point.

As to the pleasantness which it may dispense, as a mere beverage, the Malt Brandy is offered as an elegant and ample substitute for Cognac; but it is confidently asserted, that in more essential and important properties, as attributed to it, and as delineated in a former advertisement, it contends for superiority, which a scientific analysis can maintain. Its extreme purity and mel-

After the public fairly estimate its merits, such as can command a choice, will, surely, so it will afterwards be disposed of at private sale, far respect comfort and health, as to abstain from the use of the ordinary run of whiskey, frequently the product of corn; which, when new, is calculated to corrode and eat out the interior of the most sturdy system.

Of French Brandies nearly the same may be said; for few constitutions can contend against their heavy astringency, combined with the deleterious consequences of their corrosive powerwhen there is an indulgence in their constant use. Two large Mares, half blooded, one four, the other Certainly no individual can be willing to sap the five years old, warranted sound and to work stamina of his existence, when in his power to nurture and promote health and prolong life!

Such substantial materials as malted barley and wheat and rye, are entitled to, and should command a preference over the slender commodity of bay colour—price \$40.
of which Cognac Brandy is the product. Dis-Some Pigs of the Parkinson, Bedford and Suffolk tinct from the demands of patriotism and national consideration, it is fearlessly submitted to the public; not dreading even the most severe scru-A

Orders for the pipe, barrel, half barrel or demijohn, will be received by W. Pechin, personally, or through the medium of the post office.

Any brandy delivered not giving complete satisfaction, may be returned.

The term " peculiar" would, indeed, be rican Farmer. rendered interestingly emphatical, if a reference One 3 years old half blooded Alderney Cow, got could be safely made, to a justly celebrated modern hublication, for the character given of the root, which constitutes the important Cognac flavoring T and coloring principle of the Malt Brandy.
PILGRIM'S CHOICE,

Baltimore County, Aug. 5-8.

A Grazing or Market FARM, FOR SALE.

The Stockholders in the City Bank of Baltimore are especially advertised that there will be exposed for sale, at public auction, in the Exchange, at Baltimore, on Monday the 25th of Norember,

A Tract of Land, lying North and South of the Baltimore and Frederick Town turnpike road, near the 5th mile stone; it is composed of several racts or parts of tracts, containing upwards of three hundred acres, about eighty acres are in wood the residue, or a great part thereof, in grass. It is believed that there is not a tract of land of the same extent, within six miles of Baltimore, its equal in fertility, and none better adapted to plaster. The land adjoins Mr. Skinner's farm Bovally, and would form, if united, a very fine es tate. The buildings are, a house on the north side of the road, suitable for a manager, and on the south side there is a small tenement that has hitherto been occupied by the labourers employed on the farm, and near to which there is a very extensive and well arranged barn, built within a few years past. A stream passes through the meadow; it is said that on it there is a seat and fall suitable for a country mill. Those who may desire to purchase a market or grazing farm near Baltimore, may not in twenty years find one in every respect so desirable.

Upon the authority of the late manager, it is stated that upwards of five hundred dollars have been received for grazing alone, between har-vest and Christmas. The land is generally well enclosed by a good post and rail fence.

A plat of the whole tract indicating the situa-tion of the wood, its extent, &c. &c. can be seen by a reference to the undersigned. The terms of sale are one-fifth cash or City Bank lysis can maintain. Its extreme purity and melowness will be declared by the pleasing and hesolutions will be declared by the pleasing and hesolutions will be declared by the pleasing and hesolutions of the same of the sam manner endorsed. TURE in the University of Virginia.

It was to have been expected that a SOCIETY which boasts of its Barbours, Randolphs, Cockes, Divers, Minors, and others—with President Madison at its head, would do something worthy of themselves and the great objects of their association; accordingly we find that classic scholar energies of a great mind, has now been invited by his neighbours to put forth the weight of his name and opinions, in support of a most noble project. which give facile opportunities for the fullest developement and best use of talents bestowed by the Creator upon rising generations; reserv-ing at the same time, the disinterested and be-nevolent efforts of all who survive the fiery ordeal of the public service; and how appropriately do these tried sages employ their time, when they exert their persuasive influence, in fur-therance of social projects, wisely calculated glory of this age, and the happiness of posterity.
This appeal to the people of Virginia, will we

ENCES on the pre-eminent ground which she deserves to occupy." May success attend this enlar from ind terprise of Virginia, and her sister states reap monwealth. the benefit of her bright example.

Edit. Am. Farm.

Proceedings of the Agricultural Society of Albemarle, Va.

MONDAY, OCT. 7, 1822. Officers elected to serve for one year.

JAMES MADISON, President. TH. M. RANDOLPH, 1st Vice President. JAMES BARBOUR, 2nd Vice President. NIMROD BRAMHAM, Treasurer. PETER MINOR, Secretary TH. W. MAURY, Asst. Secretary.

COMMITTEE OF ACCOMPTS.

Thos. Eston Randolph, Dabney Minor, and John Winn.

A communication from Wm. H. Meriwether, on the employment of Overseers,' was read.

Col. Bramham presented, in the name of John S. Skinner, Esq. of Baltimore, a small bag of Virginia. wheat and some beans of different kinds, brought To the President of the Agricultural Society of —, Bramham for distribution.

On the motion of Dr. FRANK CARR, the following resolutions were adopted:

Resolved, That this Society hold in just estimation of a general co-operation in the scheme.

The provision in the scheme of a general co-operation in the scheme.

The present seems to be an important crisis in introduction among us of the system of horizontal ploughing.

The present seems to be an important crisis in the Agriculture of Virginia. The portions of her soil first brought into cultivation, have, for the soil first brought into cultivation, have, for the plans, by students returning to their dispersed most part, been exhausted of its natural fertility, homes, would tend to spread sound information on

We have just received the following account of proceedings had at the last meeting of the Agricultural Society of Albemarle; and we hasten to lay before our readers, the plan which has been devised by that Society, for the establishment of a PROFESSORSHIP of AGRICUL
TURE in the University of Virginia

ing Preamble and Resolutions, were adopted:—
WHEREAS, the establishment of a Professorship of Agriculture, in one of the principal seminaries of learning in this State, is a measure emi-nently calculated to hasten and perpetuate the themselves and the great objects of their association; accordingly we find that classic scholar and profound statesman, who from his earliest years, has devoted to his country's service, the grounds to believe that such an institution may be incorporated into the University of Virginia, a position at once most advantageous and convea position at once most advantageous and convenient to every part of the State: And whereas this Society could not make an appropriation of its funds more conducive to the permanent at-Well may this people glory in their Institutions, which give facile opportunities for the fullest tainment of the primary objects of its institution —and as it is reasonable to expect that all the Agricultural Societies, the Farmers and Planters generally, will cheerfully contribute to an Establishment of such universal interest.—Therefore

Resolved, That one thousand dollars of the sum now in the hands of the Treasurer of this Society. be appropriated to the establishment of a Fundthe profits of which shall go to the support of a to improve our own country-to augment the Professorship of Agriculture at the University of

Resolved, For the furtherance of this design, crease the said fund, that a committee be ap-pointed to solicit donations not to exceed one dollar from individuals in every part of this Com-

Resolved, That the aforesaid appropriation, together with all that may accrue under the foregoing Resolutions, be loaned to individuals on good personal security, or to corporate Bodies; sons on agriculture for its essential charge. The fund contemplated for the support of

Resolved, That the funds above referred to, together with donations of books, and property COMMITTEE OF CORRESPONDENCE.

James Barbour, Th. M. Randolph, Th. G. Watkins, Wm. D. Meriwether, and Peter Minor.

of any other description, be with the permission of the Legislature, transferred to the Rector and Visitors of the University in their corporate capacity.

(Extract from the minutes.) P. MINOR, Sec'ry.

In pursuance of the above resolutions, the following letter has been addressed to the Presidents of the Agricultural Societies in the state of

Society to provide for Agriculture the advantage success in rearing new species or varieties, of of a Professorship, to be incorporated in the peculiar value, would yield in seeds and stocks, University of Virginia; the means proposed for a profit defraying the expenses incurred on this making the provision; and the hope entertained head.

AGRICULTURAL EDUCATION. pointed to procure and present to Col. Thomas without being repaired by a melicrating system M. Randolph, Governor of this commonwealth, of husbandry; and much of what remains in forest

As a further means of advancing the great object, it has occurred to the Albemarle Society, that a distinct Professorship in the University of the State, if sanctioned by the proper authority,

To the due success of agriculture, as of other science; the latter without the enlightened precepts of the former, is generally enslaved to ancient modes, however erroneous, or is at best but too tardy and partial in adopting salutary changes. In no instance, perhaps, is habit more unyielding, or irrational practice more prevalent than among those who cultivate the earth. And this is the more to be lamented, as agriculture is still so far below the attainments to which it may fairly aspire.

A professorship of agriculture might derive spe-Resolved, For the furtherance of this design, that the President be requested to prepare an adher citizens; one and all of them will feel it to be their duty, and find it a pleasure to assist the illustrious Madison in placing AGRICULTURE, "the mother of all the ARTS and SCITURE, "the mother of all the ARTS and SCITURE, and the committee be and the committee be and the committee be and the committee be and comm ture is a field on which it has already begun to shed its rays, and on which it promises to do much towards unveiling the processes of nature to which the principles of agriculture are related. The professional lectures on chemistry, which are to embrace those principles, could not fail to be auxiliary to a professorship having les-

The fund contemplated for the support of such dual shall amount to one thousand dellars or up-wards, landed security shall be required: That the interest shall be payable semi-annually, and shall be resinvested until the resinvested and the same transport of such from unexpended subscriptions, from special do-nations, and from a diffusive contribution not exshall be re-invested, until the yearly profits of the Fund shall be sufficient to afford an income equal at least to a Professorship in the University. that with the other resources, means may be gathered not only adequate to the immediate views entertained; but justifying an enlargement of them.

Should this prove to be the case, it will be an improvement of the plan of agricultural instruc-tion, to provide and place under the superinten-dance of the Professor, a small farm in the vi-cinage, to be cultivated, partly as a pattern farm illustrating practically a system at once profitable and improving, partly as an experimental farm, not only bringing to the test new modes of culture and management, but introducing new plants and animals deemed worthy of experi-ment. In obtaining these, aid might be found in wheat and solide Cocan by Capt. Ridgely of the frigate Constellation—whereupon, Resolved, that the Society's thanks be presented to Mr. Skinner, and that the said seeds be left in the care of Col.

Society of Albemarle, explain the wish of the ries; and it might well happen that occasional tries; and it might well happen that occasional tries; and it might well happen that occasional tries; and it might well happen that occasional tries. the patriotic attention of the public and private

By order of the Society, JAMES MADISON, Pres't.

-00 OBSERVATIONS, &c.—OLIVES, GRAPES WOOL AND SILK.

We have just received the following Tract from its worthy author, whose benevolent feelto exert his talents for the benefit of Society. To improve the condition of his fellow beings, to human happiness, are the high objects of his constant and generous solicitude.

Edit. Am. Farmer.

State.

It has frequently been asserted, and probably with truth, that slavery is an obstacle to improvements and to the increase of the white population. The late distressing events in Charleston prove that it certainly is attended with con-

siderable danger.

Very few persons in the Southern, as well as in the Northern states look upon it in any other light to administer palliatives. Some means at this time seem necessary to be adopted to check the growing evil, whether it is intended ever to suppress slavery totally, or merely to modify it so as to correct in a great degree the worst effects of by the French government. it and prevent, if possible, the recurrence of the From these indisputable for

In order to answer this question, it will be necessary to take a brief view of the present state of things, considering at the same time the probable causes that led to the evil complained of.

There is not the smallest doubt that the condition of our slaves has been very greatly and progressively ameliorated since the revolutionary war. The spirit of philanthropy which has been more generally diffused with education, knowledge and milder manners, joined particularly to the self interest of the owners of slaves, have availed much. The introduction of labour-saving machinery has rendered the labour of the slaves much lighter than formerly, beside which they are better fed, better clothed and treated less harshly. If we compare the situation of our slaves with that of the labouring class of other countries, the former will be found, most undoubtedly, to have considerably the advantage. Whatever be the dearth of provisions, clothing, fuel, kc. they are sure to be abundantly supplied.—When they are sick, they have always good medical attendance; they have no uneasiness con-

spirit of imitation and emulation, which is the when disabled by disease, infirmities or old age, increase of their number by obliging all slaves spirit of imitation and emulation, which is the when disabled by disease, infiliables of old age, and entersource of improvement in every art and enter-they are certain of their usual support without ever shall acquire their freedom, by prize.

Therefore the great object of governments is, or ought to be to promote the population of their country in proportion to their effective population. Therefore the great object of governments is, or ought to be to promote the population of their country in proportion to their effective population. indulgence of masters, many have been allowed to able for them, that the people may be industri-learn to read and write. It is among these idle ous, honest and happy, as well as numerous. We pampered fellows that we must ever expect to have here an uncommon inducement for endeafind discontent, and it is a well known fact that vouring to produce such a state of things, and it all the blacks concerned in the late attempt at an is that were our state thickly inhabited by an ininsurrection belonged to very indulgent masters, dustrious class of white people, our slaves would ne and were, almost without exception, fully in the ver think of making any attempt at an insurrec-enjoyment of their master's confidence. Many of tion. Besides this, if it should ever be thought than as a great evil entailed upon us by our anterest of them were, or pretended to be, very religious, advisable to suppress slavery entirely and send cestors, and, like hereditary diseases of the human body, the cure is extremely difficult, and of St. Domingo, it is almost without an excepmight be independent and happy, if they would be all that can be done with comparative facility is tion also, that the most indulgent masters were the first sacrificed. Severe masters kept their slaves at work on the plantations a very long time after that country was in a state of re-bellion and the negroes had been declared free

slaves in towns, and which it becomes our duty to remedy, is that many mechanics and others hire their own time from their owners. If they are intelligent and industrious, they undertake work on their own account, by which they make a great deal of money which they spend as they please, and by that means, create a great degree of jealousy among the others who are not allowed similar privileges. If they are vicious and ill disposed, it puts it in their power to do a great deal of mischief. Another source of disquiet among the slaves, one which perhaps justice and equity prevents our remedying, or which at least cannot be remedied but on the plea of expediency and the great law of nature, self-preservation, s the great number of free negroes and other coloured people who live among us. Some few of them are honest and respectable, but the greatest number are otherwise. Their mixing with our slaves renders them dangerous by their counsels and the example of the idle or dissolute night be raised, it is presumed, in this tract of lives which many of them lead. Would it country, viz: Olive oil, wool, silk, and wine.

the subject of agriculture, and to cherish that cerning the bringing up of their children, and not be well for our legislature to prevent the

of his own time; he sleeps, or he works in set this way, it is necessary to give it a directhe ground allowed him for a garden, by which iton. As for emigration from other states to this, means he is enabled to procure a few articles of we conceive it not so desirable as that from Eucomfort. But whether he sleeps or works for himself, his mind is absolutely free from any kind of trouble either for the present or the future, for himself or for his children. In short this state would be effected, but also that of the

among the most intelligent, and, by the misplaced ry article of culture, commerce or industry, suitindustrious, we should have a population of whites ready to spread itself on our richer lands.

Supposing the state of South Carolina to contain sixteen millions of acres, (accuracy is not here essential)it is thought that nearly one half of it is pine barrens, sand-hills and other pine lands to correct in a great negative property is the recurrence of the late disturbances. It is not intended here to disturbance in disturbance and surface to disturbance and barrens and sand-hills, which support at present but a very scanty population of such in-efficient people, with some few exceptions, that it may not be considered as adding in the least to the wealth or power of the state.— The land itself is considered as of little or no value in its present state. Is this vast tract of country really of no value? and is it not capable of useful productions and of supporting a more numerous and better class of people? This is what we are going to examine.

In what precedes let it not be imagined that we intend to cast indiscriminately any censure on of some exceptions of honest and industrious all the inhabitants of the sand hills. people, which serve to prove that their lands have some value, as some of them live decently and raise numerous children; and, were they taught the raising of productions better adapted to their soil, might be in comparative affluence.

sheep, and those who have tried it have suc-tages which our soil and climate offer to our paceeded but imperfectly. It cannot be denied that triotism, as well as to our industry. and Sir John Sinclair, among others, the following observations: "Wolves are named as a mo-"tive for not keeping sheep; surely they cannot source of w be serious who urge it. They abound all over ties, by afform Europe, in France and Spain, among the greaties, by afform est flocks in the world; and no wolf could get nufactures. "into my sheep houses, or at least I may say, "that nothing is so easy as to keep him out, even "of a yard. Dogs are also an enemy; but Ame-"rica surely has laws, as well as we, that make "every man answerable for the mischief done "by his dog. By night, if secure from wolves "they are secure from dogs; and by day, shep-"herds may have loaded fire arms to kill all "that approach. While they are kept by "scores, such objections may hold good; but when "by hundreds and thousands, they must vanish." It is very evident that so timid an animal as the sheep must always be protected against its enemies, and that a fair experiment can never be made with them unless it is with a number competent to defray the expense of a shepherd. A shepherd with a pair of dogs, it is believed could be easily procured from Europe and kept here at a very small expense; as the wages of such a man are there very triffing. Hundreds of exten-sive flocks would find abundant and wholesome pastures in our sand-hills, and a sufficiency of cow-peas, &c. might easily be raised for their

invaluable animal as an article of commerce, the raw materials they want. Every effort of this carcases of which would also be a most valua-kind tends to cement the bonds of our union, and ble addition to our meat markets. Colonel John L. Sullivan, in his very valuable little essay on the "principles of political eco"nomy applicable to the public works, com"merce and finance of South-Carolina," says, (page 8;) "The Southern states, whenever it is "for their advantage, will supply the rest of the states (besides their present staples,) with all "the sugar, oil and wine, they may require.—
"A report of the secretary of the treasury, a "few years ago, estimates the value imported in "one year, to have been, in wine, eight millions "of dollars, in spirits, eight millions," &c. and (in page 21,) "Those extensive tracts of sandy soil fity acres, still it would form a population of one hundred thousand; but it is susceptible of maintaining many more, probably one family or more Colonel John L. Sullivan, in his very valuable that the experiment has never been fully made.

The Olive Tree is supposed not to thrive well at berry tree grows very well here, as the writer that injurious luxuriance experienced in richer a considerable distance from the sea; but it does of this can prove by ocular demonstration, having not require a rich soil, and it is probable would upwards of one hundred of them. The climate rot. 4th. The climate is similar to those known grow and thrive in the pine barrens in the lower is very stranged as for the part of the state. Particular and convenient spots worm, and our sand-hills are eminently calculatof these lands might be selected for the purpose ed to raise great quantities of silk of the best of making the experiment with great probability quality; for it is found that, as the olive oil is of to do well in all countries in similar latitudes, effort success. The writer of this, for want of ex- a superior quality when raised on a poor sandy perience, can say nothing positive on the subject, soil, so is the silk produced from worms on the South America produce wines, and why not South of success. The winter of this, for want of experience, can say nothing positive on the subject, soil, so is the silk produced from worms on the care the olive is cultivated most successfully, and the writings of eminent authors. The celebrated ence to the author already quoted, "the Abbe Rosier, says: sier," will prove this satisfactorily.

"The choice of soil is in general very indifferent if the olive tree, since we see it grow and succeed well in sandy, stoney, gravelly, and in succeed well in sandy, stoney, gravelly, and will be objected, perhaps, that the soil of our upper districts is better suited to the writing of our upper districts is better suited to the writing of our upper districts is better suited to the writing of our upper districts is better suited to the writing soil of our upper districts of our upper districts is better suited to the writing soil of our upper districts is better suited to the writing of our upper districts of our upper districts is better suited to the writing soil of our upper districts is better suited to the writing soil of our upper districts is better suited to the writing soil of our upper districts is better suited to the writing soil of our upper districts is soil of our upper districts is soil the tree soil of our upper districts is better suited to the writing soil or our upper districts is better suited to the soil of our upper districts is better suited to the writing soil or our upper districts of our upper districts is better suited to the writing soil or our upper districts is better suited to the writing soil or our upper districts is better suited to the writing soil or our upper districts is our upper districts is soil or our upper districts is soil

vast resources, and advantages of every kind? The culture of the grape requires, or rather admits of a dense population. It has a tendency to diminish the practice of intoxication, by furnishing a lighter beverage for the working class of people; and the advantages of habits of tempersheep, like any other domestic animal, cannot be raised in this country cannot ance and sobriety are incalculable. By it a vast be raised to advantage without having some care admit of a doubt; for it has repeatedly been raised extent of country, now of no value, would rival in products some of our best lands. Who can foretell the value of these lands? Similar ones in other countries, when under this invaluable culture are, sold at enormous prices. What advantages in a political point of view! Nearly five millions of acres of land now unproductive and uninhabited, after a few years, bearing nearly the same prices as some our most valuable lands, and thickly settled by a hardy, industrious and honest people. What a source of revenue to the state, and what an efficient force for the defence nufactures.

The next and last object of culture recommended for our sandy lands, and probably the most important in every respect, is the GRAPE. the other states in population and power?

It is not intended here to induce a belief that "the same soils in the South of Europe, where health reigns perennial, yield those mild tonic wines so friendly to health, temperance and prosumer to labour and industry, in the first." Many other writers have expressed the collection of manures, and encouraged by the taining many more, probably one family or more the same opinion, and it is a matter of surprise example of abler cultivators, would soon change the face of the country and render it comparative-

cow-peas, &c. might easily be raised for their wintering.

This object, it is true would not directly tend to increase much our population, as very few persons are sufficient for a great number of sheep; but by adding considerably to our wealth and means of subsistence, would promote the intended object.

SILK is the next object to be considered. The mulberry tree, on which the silk worm feeds, is found to grow spontaneously all over the state, in our sand-hills as well as on the rich banks of our rivers. The imported seed of the European mul-

provisions, so as to be as independent as practica-

A question here naturally occurs, which is: What will be the expense of forming such an establishment? This is, perhaps, not the proper place to enter into more of the many details of the plan; but the expense would necessarily depend on the number of families first brought in, and this to be sufficient to make a very full experiment, need not be considerable; but, however the plan is carried into execution, it must be the work of time and of the efforts of disinterested patriotism or legislative assistance. A small number of families having been thus brought and settled; they would undoubtedly invite their friends to join them, and, in the course of time, when their successes could no longer be doubted, persons having capital to enable them to emigrate at their own expense, purchase land and form settlements, would come and add to the number as well as to the stock of industry and wealth of the state. Thousands of poor people in France, Germany, &c. whose industry, hard labour and the strictest economy can scarcely af-ford them the means of supporting life, would be happy to come here, and even supposing, (which is very improbable,) that they could not succeed in raising the vine to advantage; they would still be better off than in their own country, where they have no prospect of ever acquiring an inch of property. Here by their labour, they would be certain of their support, they would enjoy tranquillity and freedom, of which they can have no hope in Europe. They would be here in a country as healthy as any spot on earth; for this is most undoubtedly the character of our sand-hills. Therefore, even in the event of a very improbable failure of the principal ebject of culture, the others could not fail, and while we would have increased the wealth and importance of our state, we should enjoy the philanthropic pleasure of having bettered the condition of thousands of people, by placing them in the full enjoyment of all the addition. Those late sown, are more crisp, is grown in the full enjoyment of all the additional placing them in the full enjoyment of all the additional placing them in the full enjoyment of all the additional placing them in the full enjoyment of all the additional placing them in the full enjoyment of all the additional placing them in the full enjoyment of all the additional placing them in the full enjoyment of all the additional placing them in the full enjoyment of all the additional placing them in the full enjoyment of all the additional places. Liberty and Equality.

in the prospect of this state furnishing to the Swedes early in July. United States all the wines and brandies for their great proportion of the wool and all the silk they may work up into cloths, stockings, rib-bands, &c. Let us also view in the prospect, ticable reality.

TURNIP CULTURE.

forming each his settlement. Besides the cul-tivation of the vine, they would raise their own of a public journal, to enjoy retirement, peace Your obedient servant, and pleasure in the cultivation of his ample fields. As an agriculturist he is justly entitled to be ranked among the most useful of that valuable class of citizens. The county of Albany owes much to his spirited exertions, and his example in promoting the interests of agriculture. His farm, situated a few miles from the city of Albany, which when purchased by him a few years since, was merely waste land, and hardly considered worth cultivating, has become under his management and indefatigible industry, one of the best and most productive in the county.

The vegetable raised by Mr. Buel to which his
communication relates, is held in high esteem at Albany, and we doubt not those he proposes sending to this city will be soon disposed of after their arrival, of which we shall give notice.

To the Editors of the Statesman.

As you profess to devote a portion of your payear to a greater extent than before.

places, that the turnip requires a moist, peaty, of the quantity of butter sent to that market or very rich soil, is erroneous. It is equally an from New Hampshire, estimates it at no less error that they will not grow on old lands, provided they have a dry and sandy soil. In Norfolk there have been raised fine crops on soils which were eight-ninths silex; and perhaps they

JESSE BUEL

-00 BUTTER, CHEESE AND WINE.

Extract from the Report of Messrs. Bartlett and Harvey, to the Rockingham Agricultural Society, at the late Cattle Show in Exeter, N. H.

"The article of butter itself is deemed by your committee of so much interest to the citizens of New Hampshire as to have deserved much more consideration than it is in their power at this time to bestow upon it. The hills and vales of New Hampshire, in a climate where most kinds of grain can never be an object of cultivation, beyond the immediate wants of the farmer, suggest to us the propriety of studying the best means to avail ourselves of the profits of grazing.—Your committee will not stop to give estimates of the net proceeds to the farper to the interests of agriculture, I take the li-mers of the article of butter; for we need no berty of communicating some facts relative to stronger evidence in favour of it as a lucrative the turnip culture, which I have prosecuted this source of income, than the fact of the great quantity annually sent to market from this state, My farm, on the Albany commons, is a sandy above that of domestic consumption.-A merloam, and, so far as I can jndge, very much re-sembles the celebrated turnip soil of Norfolk, in whose extensive purchases and sales of this ar-England. The idea, which is prevalent in many ticle gave him very accurate means of judging

do best where the sand does not constitute less considerations in relation to the immense saving, than 70 per cent. of the soil. I find I grow the best crop on the sides and tops of my most sandy hills; while in places more moist, and abounding in more vegetable matter, they are of has ascertained that of all the butter from New diminished size, ill flavored, and stringy. Hence Hampshire sold in that market, about one third it has become a primary rule in my practice to only is found to be of the first sort, one third sewedes early in July.

As a crop for cattle food, I have yet but little be added the delay and difficulty of finding a at great expense, from the same countries from upon the surface of the ground, they keep perwhich we get our wines? Furnishing at the same time to the manufactures of the North, a cattle, with as little labour as any food. I have raised turnips five years, with uniform success, and always as a second cropt. You probably recollect the high reputation they obtained in the Albany market as a table vegetable. This nure, which was ploughed under, and the seed not prevent from fermenting and becoming ran-sown broadcast, and harrowed in. They were thinned and weeded with the hoe once only. The following communication relating to I contemplate sending a few hundred bushels the culture of turnips is from one who lately belonged to the fraternity of newspa-will do me the favour to call at the boat and view not shut our eyes to our faults and imperfections.

It is necessary to have an answer to these queries before I can judge of the correctness of his posihese essays, on the use of nitro muris tartrate tion that it is necessary to remove it. tion that it is necessary to remove it.

"But if raw water be added, or steam suffered crease the very misery they were intended to alto flow into the vessel, the beauty of the colour leviate. If this result be once generally attain-"But if raw water be added, or steam suffered

This is the last article I shall have to answer, ling appearance is immediately formed, &c."—
This is the nearest approximation I have made, dyeing of scarlet the liquor is so much wasted by winding the cloth into a buck of raw water, that and as it was given to throw light on another during a day's working it has to be filled up one process, it could not be considered as a receipt. This is the nearest approximation I have made, winding the cloth into a buck of raw water, that during a day's working it has to be filled up one third or more with raw water, eight or ten times; imputed, and believed without much investigation.

The charge of being uncharitable is readily imputed, and believed without much investigation. It seems I cannot be "acquainted with the the- and without any thing being added to correct its tion; but even when undeserved, it is among ory of dyeing because I left out two of the ingre- rawness. If nothing is wanted to be removed those which are most irksome in sufferance.

tisfaction; but as the young and rising artists of dients used in producing the colour, one of which from water but mineral and animal substances,

In a few days I shall answer the queries that have been put relative to other subjects, and alto be a secret of too much value to be exposed though I have felt an irresistible propensity to best promote his interest; but I would advise

HOPSON.

LETTERS on the Poor LAWS, originally published in the Petersburg Intelligencer, and addressed to the Representative of that town.

LETTER I.

SIR-I do not know if you have ever seriously considered the subject upon which I am about to address you, but as you are a general reader, I am confident it cannot have entirely escaped your notice. The great and rapidly increasing burthen of the Poor Laws demands some alleviation; and he will deserve well of his country who arrests the progress of so considerable an evil. I am aware that a proposition, to abolish the whole system of the Poor Laws, may subject its advocates to the censure of all those kind old women whose heads are as tender as their hearts —and that much popularity, with the unthinking, must be sacrificed by the first attempt to aban-don the Poor to the 'hard charity of an unfeeling world;' yet I am so convinced by arguments, which are doubtless as familiar to yourself as to me, that every permanent provision for paupers necessarily increases their numbers; that I am anxious, by means of these short letters to you, to lay the reasoning upon their subject before that portion of our fellow-citizens whose want of leisure has prevented their attention to this branch of political economy. The very general and profound ignorance of the great body of our people upon this subject is not less a matter ing matter, and if you will take the pains to look it has done upon their yarn, there cannot be a over that article again, you will find I stated doubt of its being capable of producing any that I never had an opportunity of bringing this to perfection. In another paper to my very lied to their rights or interests, were more enlightened than those of any other nation. It will advanced to maintain propositions, which more than twenty years of continual opposition and atof the burthen they impose upon industry, ined ; if the great body of the people be once fairly convinced of the true tendency of the laws to which I object, if they be satisfied that they have and it caps the climax of the whole. Can dyeing hitherto only inflamed a wound which they atgo on without letting raw water run into the fur-

all real benevolence. True charity is an ample, but a costly cloak for many human frailties; and all of us are anxwith which men flatter themselves that one of that relief on vice which they snatch from virtue. their most imperious duties here has not been neglected, because the legislature has established Poor Laws; and hence the indifference with which they pass by objects of the most abject poverty and extreme distress, with the contented declaration that they have paid their poor rates, and that the doors of the poor-houses are open. As far as regards the merits of the donor, that which is unwillingly given would be better withheld; of a Aursery, of the different kinds of good fruits, since it might be applied to some useful purpose; at Harlem, the seat of Thomas Edmondson, Esq. and the useful application of wealth is in itself within the limits of this city, as lately extended. is unwillingly given would be better withheld; since it might be applied to some useful purpose; and the useful application of wealth is in itself highly meritorious and praiseworthy. But that which is forcibly abstracted from us by a superior power, although employed in the relief of misery, can be no more imputed to us for right. cousness; than the relief bestowed by Gil Blas of the operation of laws which they dare not support of paupers, was freely given, yet would selections that may be forwarded. blessings pronounced upon him who giveth his all to the poor, be extremely problematical.— TALE OF THE MAHOMETAN AND HOG.
To give money carelessly and without regard to
the object on whom it is bestowed may be profusion and extravagance, but is not generosity or benevolence. And who are those with whom our poor houses overflow? The decayed artisan?—No! his pride will not permit him to come there, and his probity has made him friends elsewhere. The worn out laborer? No! in his youth he reared a family by his industry, and they now repay the obligation. The children of virtuous poverty? No! their parents, in this country, are yet generally able to maintain them. Except then, a few orphans and occasionally an insolated being, whom disease or accident has disabled, the inmates of our poor houses are the offspring of vice, or the dregs of debauchery. Not on-

which ero most triburat in milerance.

should very unwillingly incur such a charge, ly to support idleness and vice, but to hold out en-with a consciousness of its injustice, at the commencement of my task; for, exclusive of any but foolish and wicked. And do we not encourage personal distress at being so regarded, the argu-personal distress at the second district at the second distri personal distress at being so regarded, the ments of a selfish and unfeeling man are always listened to with suspicion and often treated with listened to with liste that there is not only no exercise of individual sure than of toil and care, live freely then, take charity in any compliance with legislative pro- no care for to-morrow, and if at any time, disvisions for the poor; but that such provisions tend directly to paralize, and eventually to destroy those finer feelings which are the source of but it may perhaps suffice us both,"—would you call such a man charitable, or prescribe Hellebore and the straight waistcoat for his madness? Yet this is the charity of the Poor Laws, offerious to possess it, while many are unable, and ed not to an individual, but to the whole mass of more, I fear, unwilling to come up to its price. the people. And the time may come here, as it A flimsier stuff, then, must be procured, which has already arrived in other countries, which will serve as well for a covering, look as well at a distance, deceive the multitude, and at length medy is applied, and speedily, more than half deceive ourselves into a belief that we have dist the profits of industry must go to the support of covered a sufficient substitute for that which is idleness. In my next letter I propose to prove that said to be above all, and without which all the Poor Laws do actually check charitable intenrest is of no avail. Hence the self complaisance tions, and are unjust inasmuch as they bestow

- "Good musselmen, beware of pork:
 "There is a part in ev'ry swine,
 "No follower or friend of mine
- " May taste, what'er his inclination,
- "On pain of excommunication."

Such Mahomet's mysterious charge-And thus he left the point at large, Had hethe sinful part express'd, They might with safety eat the rest: But, for one piece they thought it hard From the whole hog to be debar'd; So set their wits to work to find What joint the prophet had in mind.

Much controversy therefore rose; These chose the back, the belly those: By some 'tis confidently said, He meant not to forbid the head: While others at that doctrine rail, And piously prefer the tail: Thus, conscience-freed, from ev'ry clog, Mahometans eat up the hog.

You laugh-'tis well. The tale apply'd May make you laugh on t'other side. "Renounce the world," the preacher cries, "We do," a multitude replies; While one, as innocent, regards A snug and friendly game at cards: And one (whatever you may say) Can see no evil in a play. Some love a concert or a race, And others shooting, or a chase. Revil'd and lov'd renounc'd and follow'd, Thus, bit by bit, the world is swallow'd! Each thinks his neighbour makes too free; Yet likes a slice as well as he. With sophistry their sauce they sweeten. Till quite from tail to snout 'tis eaten.

Editorial Correspondence.

ARRACACHA, ZANTE-CURRANTS, FLAX DRESSING MACHINES, CIDER MILL AND PRESS, HARD SOAP, AND HUBER ON BEES. W-, Pennsylvania,

cure a supply of standards to enrich their farms, some for me. I have also instructed the same and gardens, will be such, that we presume all person to obtain for me, if practicable, some may participate in its utility, so as to remunerate plants or cuttings of the Zante Currant, an article of much consequence in domestic economy, taking—one, so long desired in this section of the country.

The 'quality' of charity, like that of merety, is not 'strained,' as we cannot be merciful from the hope of gain, so neither can we be charitable from the fear of loss: the open hand.

We, therefore, wish to suggest, that it would protect the plants regularly from the inclementation. we, therefore, wish to suggest, that it would protect the plants regularly from the inclementation of forced to expand by the gripe of the law. And yet any many are there who arrogate to them selves the praises due to benevolence, because the wealth of their county enables them to support their poor more liberally than their neighbors can afford, even while they complain alord

dressing flax, as, from the promulgated reports of it by the Philadelphia Agricultural Society, I had reason to expect, I find it altogether inefficient, and a mere bauble. Three times more can be accomplished by the common brake, than with this new machine, which is apt to tear and injure the Flax. I had two of the machines sent to me, and if you should wish to see one, I will present you with one of mine. Considering the very great difference, that exists between the two countries, in the circumstance of manual labour, I should say that the English hand machines generally are not suitable for this country. Salisbury's have been used in houses of industry. where constant employment is the object, and certainly his machines are well calculated for this purpose, as they will keep a person employ ed three times longer than would a machine more efficient.

but separate—the principle of both is common. fore made use of the limits the more freely." The press is worked with a wooden screw and lever, and the mill consists of a frame of wood, cessary to sell them upon their arrival here, and on which are placed two wooden cylinders pa-rallel to each other—having iron teeth studded Lexington, and myself, purchased them at \$750 over them, and projecting about five-eighths of each.—We have about 200 of their offspring an inch from the surface of each cylinder, and with which we are much pleased-and we are so placed as to pass between one another in the now raising about 100 of their calves a year. rotary motion given to them by the handles which are affixed, one on the end of each cywhich are affixed, one on the end of each cy-linder, but on opposite sides of the frame. A wooden trough is placed on top of the frame, and immediately over the cylinders, so that the apples when put therein, fall on the re-volving cylinders, which crush them, and the contents (the liquor and pomace) pass through into a leave the placed underseath. E. K. talks into a large tub placed underneath. E. K. tells me that the only difference he has observed between this and the Devonshire apple mills for ders of the latter being of cast iron-I have mestic pigeon, but hitherto without success. therefore thought it unnecessary to send you any sketch of my mill, but should you desire it, I shall with great pleasure comply. I have not gravelled—they appeared domesticated, descendyet put mine into operation, but I am told that ed to the yard, fed with the fowls, and would almost a man and boy may grind 100 bushels per day come to the call of my servants; they however took with it.

have favoured the public in your Journal, Vol. 4,

as we can wish for.

On the management of Bees you have favoured us with extracts from the British Apiarian ;-I presume you have seen the little book of Huber of final success, but it was of short durationsubject of natural history, than any one before to "rest a foot" near their former dwelling. or since his time. Several subsequent writers have presumed to question, and sometimes to contradict his assertions, for want of that peculiar skill, address and perseverance which belonged to Huber and his assistant. But any gentleman who hath both leisure and inclination to actually and sometimes to motherly correspondents understand the economother which and the economother properties are properties and the economother properties and the econ quaint himself with the admirable order and gratify a economy of Nature in this emblem of industry, should consult Huber, and may safely take the results of his experiments as his Code. C. S.

IMPORTED CATTLE.

Extract to the Editor, dated Versailles, Kentucky, Nov. 27th 1822.

You sometime ago, requested information of all the cattle which have been lately imported to the United States.—I am in possession of two 1 27—Rye, 70 to 75 cts.—Corn, 62 to 65 cts.—bulls of the short horned breed; one of them is Oats, 35 to 40 cts.—Flour, best white wheat, of the improved milk breed—they were imported by Mr. James Prentiss, of Lexington, in the fall of the year, 1817. Messrs. Cropper, Benson, eyed, 70 to 75 cts.—Clover seed, 9 to \$10—Timoand Co. of Liverpool, had them purchased and thy seed, 41 to \$5-Whiskey, from the warons, shipped on board the American ship Sampson, 35 to 36 cts. per gal.—Apple brandy, 34 to 32 Cap. Boyle, to the care of C. F. Price, Philadel-phia—the order was for two of the best young bulls in the kingdom, without limit as to price—none—No. 2, \$6—Bacon, round, \$10 to 11 cts. and Messrs. C. B. and Co. write as follows:-"We have now to advise that we have through a friend of ours, who is a very great judge in ces have not varied for several weeks past. these matters, procured two bulls, one of them his own breeding, out of the celebrated Durham' improved breed, and the other which he travelled some distance to procure, is of the improved milk breed .- One of them is ten months old, the other is rather older than we could have wished, but we were strongly recommended to take him; he is nearly two years old.—We have paid 50 guineas for each of them—they has no use for it. Enquire at the office of the might have been procured for much less money; American Farmer.

My cider mill and press are not, as I told you but not of such character as we have thought that I expected to find them, in one machine, ourselves justified in sending-and we have there-

PATENT HAY AND GRAIN RAKE,

Of which J. T. F. is the sole maker and vender for Baltimore County.)

This rake is drawn by one horse, and has the reputation of accomplishing as much work as ten or twelve men, and much better than is usually done with the hand-rake. It possesses great advantages over the common horse-rake, tinually on, the hay or grain being discharged at pleasure, without any stoppage or impediment.

J. T. F. has always a large assortment of wagons, carts, drays, Jersey-wagons, used by fa-milies, light-hand carts, wheel-barrows, with suitable harness for all or any of the before named articles.

Torders from any section of the country, promptly attended to.

Baltimore, November 5th, 1822.

AGRICULTURE.

PROCEEDINGS OF THE MARYLAND AGRICULTURAL SOCIETY—No. 3.

On Wednesday the 6th of November, being the first Wednesday in the month, in the year 1822, the Maryland Agricultural Society met at Easton, pursuant to its adjournment from Bal-timore, and sundry members attended; but for want of a sufficient number to form a quorum for the transaction of business, and to permit the society to attend the Cattle Show and Fair on the following day, the members present adjourned to Friday the 8th of the month, then to meet at the Court House at the hour of ten

o'clock in the morning.

On Thursday the 7th of the month, and the first day appointed for the exhibition, the Com-mittee of arrangement and such of the judges, previously elected and notified, as were in attendance, assembled at half past 9 o'clock, at Lowes' hotel, according to the rules published for the occasion; and the judges, attending from different districts of the State, were introduced to each other, and associated for the respective objects of their appointment. The Chairmen were furnished with the class of animals and articles about to be submitted to their judgment, and with a list of the persons composing the judges of the several classes thus organized; and addressed by the Committee upon the nature and importance of their trust as connected with the best interests of Agriculture, and upon the manner of performing this service, and reporting their decisions. The Committee and the Judges, accompanied by the members of the Society, and a numerous concourse of citizens, proceeded to the Field of exhibition. Intelligent farmers from most of the counties on the Eastern Shore, many gentlemen of the first consideration in the civil departments, and several respectable agriculturists and graziers from the Western Shore, and from the neigh-bouring states, attended, and honoured the meeting by their presence. Among them we observed with pleasure three Ex-Governors of the State, some members of the Senate of the United States, and the presiding Officer of that dignified body, deservedly distinguished for his ability and patriotism.

The spectators in groups and companies, as it suited their pleasure, proceeded round the in-closure and examined the animals exhibited; and although the Committee had prepared nearly eighty convenient pens for their accommodation, it was found necessary, from the number entered with the Secretary, to exclude all horses, mares, jacks and mules from the stalls, and to reserve them entirely for the cattle, sheep and swine These fine animals thus excluded from the pens were, however, brought out to the field at the appointed hour, and displayed to great advantage. The number and quality of every kind which appeared to the spectators, the proud parade of implements of husbandry, articles of household manufacture, were viewed with equal surprise and satisfaction: It was the first attempt of this nature on the Eastern real objects of the Society in proposing it were to its inhabitants than deserving the attention of not, until much more lately, properly under-the graziers and butchers who provide the stood by the Body of our farmers. Such a scene markets of the larger gities was not therefore anticipated; and in truth it on Friday the 8th of November, in the same surpassed the reasonable calculation of all. It year, the Society met at the Court House in was highly pleasing to observe the serious and Easton, at ten o'clock, according to its adjournearnest regard with which the attending farmers ment, and many members attended.

sented a fine stock of these animals.

We see, on the North and South, with pleasure, the states of New York and Virginia about to settle the preference of their favorite Stallions, by the infallible experiment of a contest on the turf. We are, by view, to form the best judgment in

our power.

By antient history we are taught the great re-spect paid to the Horse. On one occasion, his apparent sagacity pointed to the selection of a King; and at a later period, another monarch, relying on the strength and fleetness of this noble animal, in a case of great emergency, ex-claimed, "My kingdom for a Horse." Their inestimable value in forming the cavalry of the country, that important branch of the army, for the protection of the constitutional rights of the people, is tested by the practice of all the nations of Europe, where the turf has been rethe best evidence of their superior excellence .-We regret that this practice is not more frequent in our own country, as it would promote the efficiency of the national cavalry, which we consider a material portion of the national defence.

To the Honorable James Nabb, for his Horse Chance-Medley, by Chance, out of a Medley Mare, we award the first premium of \$20 To the Honorable William R. Stuart, for his Horse Messenger, by Messenger, out of a Granby Mare, we award the second pre-

ience for the turf.

A number of young horses were shewn and considered as Colts of great merit, as to size and figure; which, at future meetings of the Society, will meet, no doubt, with their just rewards.
ROBERT WRIGHT, Chairman.

NO. 2.--ASSES AND MULES.

The Judges appointed to examine and decide upon the Asses and Mules exhibited for premium at the Maryland Cattle Show and Fair, No. 3, Report and award as follows :

To Dr. Joseph N. Gordon, of Kent county, the premium of \$15 for his imported Maltese Jack; which they recommend to the attention of the

Mr. John Tilghman, of Queen Ann's county, exhibited his Spanish Jack, the Knight of Malta, which the judges think a fine animal, and worthy garded as the best nursery for fine horses, and of public attention. Mr. Tilghman likewise extheir trials of speed and bottom in the course, hibited a remarkably good Jennet, sired by the

The Judges award the first premium for a two year old Mule, to John C. Sutton, of Kent county, which they think the most perfect animal of the kind they have ever seen.

The second premium for a two year old Mule, was awarded to Samuel Merritt, of the same county, not much inferior to Mr. Sutton's; both these Mules were sired by the above Jack be-

longing to Dr. Gordon.

A pair of Mules exhibited by James L. Chamberlaine, of Talbot county, three years old last spring, were considered very good Mules. Like-wise, one of the same age belonging to Nicholas Goldsborough, was considered a very fine mule; as was also a three year old Mule exhibited by another person. A very remarkable fine year old Mule was shown by Samuel Stevens, Jr. of the same county.

The Judges are of opinion that they never saw exhibited better or more valuable Mules, upon any similar occasion, and in their judgment, they reflect the greatest credit upon those gentlemen

who have bred them.

WM. R. STUART, Chairman.

NO. 3.—BULLS AND CATTLE.

The Judges appointed by the Maryland Agri-

For the best Bull over two years old, they award to John S. Skinner, Esq. of Baltimore, a premium of \$20, for his promising and well formed Bull SULTAN, of the Devon breed.*

For the second best Bull under two years old, they award to Gen. Potter, of Caroline county, a premium of \$10, for his young bull 18 months

For the second best Milch Cow, they award to Mr. Samuel T. Kennard, of Easton, for his milch cow of the common country breed, a premium of

\$10.

For the third best Milch Cow, they award to Mr. R. P. Emmons, of Talbot county, a premium of \$5, for his milch cow of the country breed. HEIFERS.

For the best Heifer under two years old, they award to Mr. Joseph Harrison, of Talbot county, for his white Heifer of 18 months old, a premium

of \$10. For the second best Heifer under two years old, they award to Mr. Levi Stocker, of Talbot county, a premium of \$5, for his red Heifer of

the country breed.

OXEN.

For the best yoke of Working Oxen, they award to Mr. Samuel Smith, of Queen Ann's county, a premium of \$15. They are of good size and form, and tractable in the yoke.

For the second best yoke of Working Oxen, they award to Mr. Nicholas Goldsborough, of

Talbot county, a premium of \$10.

BEEF. For the best stall fed Beef, they award to Gen. Thomas M. Forman, of Cœcil county, for his large

well formed Steer, a premium of \$10.

For the best grass fed Beef, they award to Mr. Thomas Ford, of Caroline county, a premium of \$10.

The judges noticed with much pleasure ten handsome cattle of various breeds, exhibited by Col. Edward Lloyd, of Wye; among them his beau-tiful and well formed imported bull Champion, of the improved short horned breed; also his remarkably handsome imported heifer Shepherdess, of the same blood.

They were also much gratified with the fine appearance of two bull calves, exhibited by the said gentleman, and sired by the famous Teeswater Bull Bergami, shewing the great advantages to be derived by a single cross from the best improved stock.

They also observed several fine beef Steers, of Col. Lloyd's, of good size, and possessing many good points belonging to excellent beef, and shewing that they had beed fed and managed in a

superior manner.

They also viewed and particularly admired several very fine milch Cows and two spayed Heifers of the common country breed, exhibited by Nicholas Hammond, Esq. of Easton; two of the milch cows were of a large size and very fine appearance, and showed that they had been well fed when young, and treated with proper attention—the best mode of improving the country breed.

The Judges were much pleased with a fine Heifer, exhibited by Dr. George W. Thomas, of Chester Town; but as she had taken a premium at a former exhibition of this Society, they are of opinion that she is not entitled, from that circumstance, to a premium at this time. They also noticed two bull calves of the Polled breed, exhibited by the same gentleman, which evinced his laudable attention to the improvement of the best breed of cattle.

The Judges also noticed a yoke of working oxen, exhibited by Nicholas Martin, Esq. of promising

appearance.

Thomas Emory, of Queen Ann's county; one as follows: yoke three years old, and the other under two; To James very gentle and governable in the yoke. These oxen, from having been accustomed to the yoke Ram exhibited. at an early period, proved the great advantage of breaking such animals to the draft when young. An additional pleasure was derived from the and Bakewell blood. knowledge that these oxen had been gentled and broken to the yoke by two of Col. Emory's sons, rery active and fine looking youths, who were both present. When the sons of respectable farmers are thus taught to labour in early life, and ed Bakewell blood. These were the only wethers kins' is a handsome specimen of his ingenuity; to believe that they are not degraded by following the plough, we may reasonably expect to see the greatest improvements in agriculture.

HENRY MAYNADIER, Chairman.

NO. 4.-SWINE.

The Judges appointed to decide on the merits of the Swine, entered upon that duty with a confidence inspired by the fine and beautiful display of animals submitted to their inspection. They take leave to express the high gratification they experienced, on finding their most sanguine ex-pectations so far surpassed. They consider the time as near at hand when this most valuable, but much neglected race, the very basis of hus-bandry, will assume that high station among our domestic animals, to which their importance so justly entitles them. After devoting to this subect, their most deliberate consideration and their best judgment, they proceeded to award the premiums as follows :-

For the best Boar, to George Wright, of Queen

NO. 7.—DOMESTIC MANUFACTURES.

The Judges, appointed by the Committee of arrangement to examine the articles of Domeswere not brought up. They would have afford-tic Manufacture which have been exhibited, ed, had they reached the field, an interesting vaand to award the premiums to which they might be thought entitled, have performed that

was, with respect to some articles, but little been much inferior to their selected specimens, miums, of which there was not a single specimen offered. The Judges hope this will never be the case again, and that, whenever a future opportunity shall be presented, every person possessing a really good article, will not hesitate to become a competitor for the premium. There are unquestionably many individuals, superior to those which were exhibited; some of whom might have obtained the silver plate, if

The first thing upon the list, for which the young Boar and Sow, whose great growth and healthy appearance, fully entitled them to the cide between the candidates for this premium, ufactured in all the surrounding country, that one. It belonged to Mr. Abel Gouty, of Caro-That Mr. Nathan Townsend is entitled to the line county, to whom the premium is awarded.

considered very substantial and excellent arti-

offered, and they were so nearly equal in quality, that their decision was principally made up on account of the superiority of Colours. The Judges award the premium to Mrs. Mary Loockerman, of Talbot county: The other piece was exhibited by Mrs. Lucretia Teackle.

Of HEARTH-RUGS the exhibition was truly gratifying, and the competition much greater than the Judges expected. They have awarded the premium to Mrs. Delila Byus, of Dored the premium to Mrs. Delila Byus, of Dorchester county; but they are constrained to deciding between Mrs. Byus's, and the rug of Mrs. Eliza T. Goldsborough of Talbot county.

The Judges beg leave to recommend to the Cincinnati, "contains three times as much colouring matter as what is raised in England," being so strong that you "have been enabled to deciding between Mrs. Byus's, and the rug of warded, be respectfully presented to Mrs. Eliza T. Goldsborough of Talbot county.

There were several others presented, very Levin Caulk for his Counterpage. These are in contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near Cincinnati, "contains three times as much colouring matter as what is raised near contains three times as much colouring matter as what is raised near colouring matter as what is r Judges particularly noticed one belonging to in quality and value to those of the same kind, rect information, I should have looked upon Miss Mary M. Dawson, of Talbot county, and to which the premiums have been adjudged, that it as merely the boastings of a person ignorant another to Misses Caroline and Henrietta Harthe Judges feel particularly anxious for the sucriss, of Rockhall, in Kent county. Indeed all the cess of this recommendation. rugs were beautiful and highly creditable to the makers.

The display of Counterpanes was also ex-eedingly pleasing to the Judges. They have ceedingly pleasing to the Judges. They have awarded the premium to Gen. William Potter, of Caroline county. They have, however, to make a similar declaration with respect to this article as to that of hearth-rugs—that they had real difficulty in determining between Gen. which, four offered by Mrs. Jane Catrop, of Tal-

to be entitled to any premium.

There were two pieces of TABLE-LINEN ex-ty. hibited; but the Judges did not think them any mium offered by the Society for the best parcel way remarkable, and therefore have awarded no premium for this article.

mium offered by the Society for the best parcel C. GOLDSBOROUGH, JOHN LEEDS KERR,

OF Towelling, there was none presented.

There was but little competition with respect to knit woollen Stockings. The Judges have awarded the premium to Mrs. Elizabeth Rathell, f Talbot county. There was but one pair of knit cotton Stockings, and only one pair of knit thread Stockings. The first was offered by Miss Eliza Jones, and the last by Mrs. Mary Jones, both of the same county ; to whom the premiums harcel was exceedingly admired-no flour supe-

were respectively awarded.

Easton, Nov. 8, 1822.

* To give the Judges of this article the most agreeable means of deciding on its value, a small parcel of bread had been laid on the table. This rior, or, as some thought, equal to it, had ever been seen before. It was an uncommon sample, There were several other articles produced been seen before. It was an uncommon sample, for inspection, for which the Judges had no authority to award premiums, but which deserved and had been prepared at a neighbouring Wind Mill, from wheat raised by Mr. Tench Tilghman; to be admired. A specimen of Lace sent to the who will probably have 1500 bushels next year, at digo plant did not afford more than sixteen to the who will probably have 1500 bushels next year, at the service of Farmers who desire there were several other articles produced been seen before. It was an uncommon sample, of South Carolina, and soon after he had given up the making of indigo, he informed me, as nearly a service of the servi

FROM THE NEW YORK STATESMAN. ON DYEING.

To my Brother Dyer of Cincinnati.
In my last essay I promised to give an answer to some queries that were put to me in the course pidly acquire a princely fortune; and if this as-of your observations on dyeing. The firs on or-sertion of yours has not been thrasonically spo-

Before I answer those questions, interesting only to yourself, I must beg leave to take notice Mr. John Willis, of Oxford, submitted to the of some assertions made by you that "no good Judges a bottle of Wine made on the 7th day of black, blue, green or purple can be produced September last, of Constantia Grapes, cultivated without woad, and that all other modes are imgo on to say that no substitute for woad can be found; but that the woad you have raised near

have considered it as unworthy of being answered, for every dyer there of the least information. would have seen it in its true light; but the very formidable impression which it must necessarily produce on the American dyers, who cannot be expected to have much judgment in the art, makes it necessary that the fallacy of your statement should be exposed. I do not suspect you The Judges, to whom it was referred to decide of having wilfully mistated facts, but I charge the quality of the different parcels of Butter, you with having no knowledge of the original Potter's counterpane and a very beautiful and offered for premium at the Cattle Show and Fair, properties of woad, and of having your judg-excellent one exhibited by Mr. Levin Caulk, of on Thursday, the 7th inst. report,

Talbot county. There were several others on That twenty-eight parcels of Butter were preconclusions that are diametrically opposed to part of which were of very good quality. From are calculated to do an immensity of mischief,

Long before your grandfather's great, great grandfather was ushered upon this globe, all the blues made in Europe were dyed with woad alone, nor was indigo ever seen there until America was discovered-therefore there can be nothing extraordinary in your being able to colour

blue with it at the present day.

market, for every acre planted, and each hundred, when it has been raised in a good season perty of Mrs. Jonathan Spencer, of Talbot counis said by some to contain two per cent. of indity. The Judges therefore award to her the prego, and by others three, and during a certain go, and by others three, and during a certain period of the late continental war, the French obtained their principal supply of indigo from this plant. You have asserted that the woad you have raised in the state of Ohio, will give three times as much colouring matter as that which is raised in England. I must beg leave to remind you, however, that we have nothing more than your bare assertion for this highly important statement, but should you be correct, you cannot possibly make money more rapidly than by raising this very plant and manufac-turing it into indigo. In a letter I received some few years since from Gen. Wade Hampton, then his negroes during the manufacturing, and the small produce, it barely paid expenses. Now my dear sir, if you can obtain one hundred and sixty pounds of even ordinary indigo from one acre of land, you never need go away from the spot where you now are, for there you may ra-

fect, expensive and mischievous." This is strong fect, expensive and mischievous." This is strong fect, expensive and pre-supposes that you have in your possession, either from your own practice, or from that of some other persons equally respectable, documents to prove that no other plant can be successfully used in place of woad; if can be successfully used in place of woad; if the indigofera.

This is strong of reference.

You further ask me to give a description of 250 lbs. of green grass.

No kind of grass supports the heat of the sun better—and from the first of July until killed by growing wild in your woods, that is, a species of the frost, it will afford a constant and abundant the indigofera.

The seed should be sown as early in the spring frost is over and the plants. you are in possession of such, you cannot con-fer a greater favour on mankind than by making GUINEA GRASS.

GUINEA GRASS.

Extracted from the Wilmington Recorder, North Carolina, by request of the writer.

Mr. Smith Lam so much of the writer.

Mr. Smith Lam so much of the writer.

GUINEA GRASS.

as the danger from frost is over, and the plants set out when two or three inches high. They will readily take root. A basket or two of the young plants will be sufficient for an account. both as colouring matter and as a medium of fermentation, and that the former is brought into action by the latter. Now, notwithstanding your broad assertion that every substitute for it must have a mischievous tendency, I cannot but believe that if any plant can be found containing an equal quantity of colouring matter, with succulent juices sufficient to bring that colouring matter into action, it cannot but answer as good a purpose as woad; and further, that if a plant can be found containing a much greater portion of colouring matter, with the necessary succulent juices, it must answer a better purpose than woad. That the indigofera, tinctoria, or the wild indigo plant, is the very ma-terial that will be found superior to it, producing more colouring matter that shall be superior in permanency and brilliancy, I shall, against your bare assertion, bring the authority of Francis Cauch, Anderson, Roberts, Mungo Park, Marsden and Barrow.

You wish to know "if there be a demand for woad here." I have had woad for sale in this city for about twelve months, of prime quality, and highly approved of by those who have used it, and in that time I have sold about thirty hundred: how much others have disposed of during the same period I cannot inform you. I have now between two and three tons in the market and have offered it at a low price. The fact is that only a few of the manufacturers are as yet in the way of using woad, and for your further information, I must observe, that a gentleman who has land admirably adapted for the purpose is about to undertake the manufacture, secundum ertem, and he is determined to sell it at a moderate profit, for the purpose of encouraging the

consumption.

On your second query, whether "the manufacturers here would give a reasonable compen-sation to be instructed in the art of dyeing," I am not competent to determine; and if I were, it would be improper for me to give advice on the subject, as I have a work ready for the press, the price of which will not exceed three dollars, which, to the best of my knowledge, will give instruction on every process of the woollen manufacture, and of every colour in dyeing. Should this work prove deficient, it is very likely that your knowledge may then become doubly valuable.

who may happen to require it can answer. The best instructions, that were ever given for manufacturing of woad, are contained in a letter from the late Mr. John Parish to the Bath and West from plants set out the first and second week in of England Agricultural Society, a copy of which is the second week in May, without any trouble except cutting down.

ken, I congratulate you as being on the high road to fortune and to fame.

In the next place you have asserted that in your opinion no substitute for woad can be found," and that "the attempt to produce certain colours with any thing else would be impersional colours with any thing else would be impersionable of purchasing it as a book feet, expensive and mischievous." This is strong feet, expensive and mischievous." This is strong of reference.

Ven further ask containing a description of 250 lbs of recent of the 25th September it had been cut four times, and in two weeks would be cut the fifth.

From twenty roots, the fourth cutting yielded

mense importance, of introducing the culture and at 25 cents a paper, containing four ounces.*

propagation of the Guinea Grass, and of the highly beneficial consequences that will reward those family to keep a cow in town, or supply a dray who will take the little trouble of trying faith-horse with food all the summer. fully, an experiment, that I cannot resist the temptation of making one more effort to bring it into notice. The paper you published was too long for the attention of many readers, and the kindly brought me some seed, which Mr. Gales facts too scattered to obtain their particular no-obligingly sent me, I sowed part of it in a bed opportunity, of essentially serving your customers and country, by sending you a short but distinct view of the important subject, from a former piece, at home, with 200 roots; and from the same

proportion of the product.

In the East Indies it grows to the height of seven feet-admits of being frequently cut-makes excellent hay. Cattle eat it both in a fresh and

dry state with great avidity.

root and grew finely.

When the plants attained a proper size, he took them up, and dividing the roots, set them out this work prove deficient, it is very likely that your knowledge may then become doubly valuable.

The answer to your first query will be an answer to your first query will be an answer to your third.

You request also to know, "if any persons here are desirous of becoming acquainted with the manufacture of woad," and if "they would be willing to give a reasonable compensation for the plants attained a proper size, he took them out this work prove deficient, it is very likely that your knowledge may then become doubly valuable.

The answer to your first query will be an answer to your first query will be an answer to your third.

You request also to know, "if any persons here are desirous of becoming acquainted with the manufacture of woad," and if "they would be willing to give a reasonable compensation for the lot very poor soil—grass there 6 and it." These are questions which none but those who may happen to require it can answer. The

LETTER II. ON THE POOR LAWS.

SIR-I have failed in the object of my first convince you that, the attempts of a Legisla-ture to make people charitable have a tenprison. The same inequity, profligacy, and de-bauchery reigns in one as in the other. The same love of idleness, the same hatred of honest industry, the same contempt for laws, whether human or divine, the same cunning and falsehood, the same resolution to prey upon their fellow men, and the same propensity to blaspheme their Creator, rules the poor-house, the procession started for the parish church in the following order:

1. Tanners', Skinners', Curriers', and Glovers', company.

2. Spinners, Weavers, and Woolcombers.

3. Shoemakers.

4. Carpenters and Join-

stant and laborious toil? But suppose a miracle, let him go out unhurt from the furnace of
this fiery trial; let his social qualities resist the
force of example; let his affections be deaf to
the voice of persuasion; and his morality impenetrable to the shafts of ridicule—what good
has the legislature's charity done him? Can
has the legislature's charity done him? Can
has the legislature of his feelings. charities of a more numerous class?—those whose affords us light. only charity consists in giving money. The greater portion of this class have much feeling, but at least as much dislike to trouble; they are indeed scale what is effected by each lamp or candle humane, but their apathy cannot be made to yield to the active offices of humanity. There are some of these men, who, if they had the proper sum in change to give to a beggar, would bestow it freely, but who would not walk twenty yards to procure it. Such men give money to the miserable, not more from charity than from the oil of the oil without its charcoal.

The cil is to be decomposed in interval of their sum of the universal population of the Globe is 632,000,000 thus subdivided—its decomposition, or convertion into gas) we are to be presented with all the illuminating proto the miserable, not more from charity than from the oil without its charcoal.

The cil is to be decomposed in interval.

Estimate by approximation—In Europe, Births, to the miserable, not more from charity than from selfishness, and a love of their own ease. They suffer less in giving a few dollars to the wretches whom accident casts in their way, than they would suffer from a reflection that possibly one will be state of an air to the pipes in the streets.

Deaths, per annum, 6,371,370; per diem, 17,458; hour, 727; minute, 62; second, 1.

Deaths, per annum, 5,058,822; per diem, 13,860; hour, 577; minute, 62; second, 1. would suffer from a reflection that possibly one of those objects had actually died for want of that relief which they withheld. The Poor Laws do not increase the charities of this class—they take away its principal motive to benevothere—since they assure it that the poor shall not actually died for want of the state of an air to the pipes in the streets, and thence to each lamp, where it will be set that the state of an air to the pipes in the streets, and thence to each lamp, where it will be set they assure they assure it that the poor shall not plence—since they assure it the sta not actually die, nor even be in any great danger of starvation. Those who would support the poor from the ostentation of humanity are de-prived of that inducement, since a man can however is the case.

From the Rochester Telegraph, New York.
Arrived at this village on Wednesday last, the canal boat Western Trader, Captain Garney, from Utica, with a full freight of emigrants, conhave come the distance of 150 miles, for the moderate sum of \$1 50 each; thus completely elu-cidating one of the many important benefits of the great western canal.

> >0 TANNING DISCOVERY.

Six weeks since, application was made to a person for the loan of one thousand pounds to a young chemist, who had made a discovery; he was too poor to substantiate by experiment. The money was obtained, and in a few days re-paid by the borrower, already raised to sudden affluence by the private disposal of his invention; It is a new mode of tanning skins, combining such rapidity and economy, as promise to the public an immediate and immense advantage. Raw hides hitherto lying twelve months in the tan pit, and subjected to a process otherwise defec-tive and precarious, are now perfect leather within six weeks, and at less than half the expense. The gentleman who bought the invention, is a noted opposition member and contractor; and from the terms of his stipulation, we may form some judgment of the probable magni-tude of the results. He has paid him ten thou-sand pounds down, he has given him obligatory deeds securing him £5,000 on the first of January, £5,000 per annum for the four years next succeeding, and afterwards £11,000 a year for life It is expected that the price of a pair of boots will not exceed eight shillings, and a corresponding fall will be produced in all articles of leather manufacture.—London Globe.

PATENT GRIDIRON.

New-York, 12th Nov. 1822.

To MR. MUSSEY.

I willingly, sir, give you my opinion on your patent, economical utensil, the hollow-barred Gridiron, with a Reflector and a Dripping-Pan.

Broiling has been considered as the most sa-unpleasant taste. voury, but at the same time the most wasteful way of cooking meat. Your invention removes in a great measure, from this operation, the charge of extravagance, by saving the fat and juice from destruction by the hot coals. The rays of heat bent on all Farmers to report whatever they be-repelled from the bright surface of tin, add to it lieve may be new and useful to others, and leave

dollars. The elegant lace veil which attracted mirably calculated to render flesh palatable in a so much attention, made by Mrs. Bush, of this saving manner, I recommend your gridiron and city, was purchased by John L. Graham, Esq. at 21 dollars. combining the luxury of eating with frugality in

Unparalleled Munificence.-The Hon. Stephen Van Renssalear, has engaged Professor A. Eaton, of Troy, to take a Geological and Agricultural Survey of the Great Canal route from Albany to Buffalo, a distance of 380 miles. The survey is to include the breadth of ten miles. An accusisting of eight families, in all 60 persons, who rate investigation of the rocks, soils, minerals and plants, is to be made on both sides of the canal.-The method of culture adopted by the best practical farmers is to be sought out, and all varieties of soil to be analyzed .- Albany Daily Adv.

BUTTER MAKING IN COLD OR WIN-TER WEATHER.

200

Rahway, New Jersey, Feb. 24, 1822.

J. S. SKINNER, Esq.
Respected Friend,—Thy favour with the papers came safe, for which please to accept my most sincere acknowledgments. I feel myself greatly in debt already, and have a sincere wish, if I only had the means, to be in any way useful to the support of a paper, which I believe will produce the most important and beneficial effects,

upon the agriculture of this country.

If not generally known, it may be useful to mention a very easy and excellent method of making Butter, in winter, or in cold weather, late in the fall. We began it last fall, and have practised it since with uniform success. It consists simply in heating the cream, instead of souring it, in the usual troublesome and tedious manner.-The cream, as it is skimmed, is put into a vessel, until enough is collected for churning, and kept in any convenient place where it will not freeze. It is then poured into a copper or brass kettle and hung over the fire until scalding hot, but is not suffered to boil-it is then poured back again into the cream pot, and left to stand till even-ing, by which time it will be nearly cool, rather cooler than new milk; it is then churned, and with us, has never failed to produce good butter, in a very short time; and of a better quality and colour than when soured in the usual way. It is indeed scarcely any more trouble to make butter in this way in winter, than in the usual mode, in summer. Care, however, must be taken that the fire be not too strong, as if the cream should be in the least burnt, it will give the butter an ply to

I thought it right to mention this process to you, as we have found it to save a great deal of trouble and some vexation. And now that we have such a convenient medium, I think it is incum-

I am respectfully thy friend, HUGH HARTSHORN.

CHILLICOTHE TWIN CALVES.

We were, on Saturday last in common with a number of persons, favoured with the sight of these beautiful animals. They are 2 wins, and were raised and fatted by our respected fellow-citizen, GEORGE RENICK, Esq. of this neighbourhood. They are seven years old; and for size and beauty have seldom been equalled in America. The Steer was weighed in our premuch; but as she appeared somewhat wild, it was deemed unsafe to weigh her. We understand that it is Mr. Renick's intention to take them down the river to Orleans.

Chillicothe Supporter.

12. The Land and the Ocean-The value of the first, much depends on the free use of the last. 13. The Matrons and Maidens of Confederating to establish, with a view to elicit all that is ed America—Our last toast, but the first objects known among us, in regard to the improvement of our esteem and affection.

MR. GARNETT'S ADDRESS.

FELLOW CITIZENS

with regret, that nearly one half of the premium at last become sensible of the great benefits and objects, always present to our minds, were plate prepared and offered by the society, has not which may result to our agriculture from similar plate prepared and offered by the society, has not which may result to our agriculture from similar we zealously to pursue such a plan, for a few been awarded for want of competitors. The meetings and exhibitions, to the one now before years, and exert, for its promotion, all the agriture Show; but that the munificent intentions and that we have not, nor could we have, for the first stead of frequently having to undergo the pangs laudable exertions of the society will be met by time, an exhibition, to be compared with the of separation from our dearest friends and cona corresponding confidence and zeal on the part many highly imposing, and praise-worthy spec- nexions, compelled to seek, in distant regions.

friends, there cannot be a more absurd, nor perhis own. If such belief be not sheer madness, it is, wise in their own conceit, either to receive, or impart knowledge. As well might we expect, that the plants which are reared for human sustenance, would yield their fruit without human labor; or that the aggregate products of human industry, exercised in all the infinitely diversified pursuits of life, would be found spontaneous in their present abundance, as that the theory and practice of agriculture can be brought to perfecperity; exorbitant gain, the tornadoes that ruin tion, or made even to approximate, in any very profitable degree, towards it, unless her sons can be prevailed upon to act more as a body, moving in harmonious concert—afleast, in regard to their great leading interests. In other words, they should seek opportunities of frequently meeting together; of conferring, consulting, and combining for the general good; of interchanging the results of individual experience and observation; of encouraging by joint, but voluntary contribu-tions, such exhibitions as we are now endeavor-ing to establish, with a view to elicit all that is of stock, of agricultural implements, of the various processes by which the soil itself can be best cultivated, and most effectually fertilized-and, It affords me a degree of gratification which in short, of doing every thing in their power, to honor to be connected with this society, I shall leannot easily express, to behold so conclusive a elevate, to honour, and to perfect the profession ever deem it my duty, to press similar topics upprosf, as this assemblage presents, that we have

a corresponding confidence and zeal on the part of their fellow citizens.

Upon the whole, however, the entire exhibition was highly gratifying. Not less than one thousand spectators attended the first day; all apparently wishing well to the cause; and many of them determined to aid it by something more efficient than mere good wishes. From this auspicious commencement, your committee anticitate of attainable parently and industry are pushing on all picious commencement, your committee anticitate of attainable parently imposing, and praise-worthy spectators, and praise-worthy spectators, which have, for that support which our exhausted soil can no longer yield, we should behold the heart-cheering, delightful spectacle of a moral, industrious, well informed, and happy population, gradually, but continually increasing, in a ratio proportioned to the the same efficient than mere good wishes. From this auspicious commencement, your committee anticitation of our lands, and industry are pushing on all our agricultural resources. We should no longer with the consequent expansion and multiplication of our agricultural resources. We should no longer with the support which our exhausted soil can no longer yield, we should behold the heart-cheering, delightful spectacle of a moral, industrious, well informed, and happy population, gradually, but continually increasing, in a ratio proportioned to the total augmented fertility of our lands, and the consequent expansion and multiplication of our agricultural resources. We should no longer with the support which our exhausted soil can no longer yield, we should behold the heart-cheering, delightful spectacle of a moral, industrious, well informed, and happy population, gradually, but continually increasing, in a ratio proportion-del to the current and the consequence of witness the rapid depopulation of several of the good old United States from the operation of On the second day of the late meeting of the are still some among us, I fear, who, in their inbert Lewis, Esq. acted as Vice-President. The following Toasts were drank, and mirth, song a finger, or bestowing a cent towards the improvement of this first and best of all occupations. Can they imagine it is all-sufficient to the two preceding days:

The Double resident and as finger, without ever spending a thought, moving the first should be following to the first object. A contrary course of several process of the constitution of our soil, as an essential means of attainting the first object. A contrary course of several process of the constitution of our soil, as an essential means of attainting the first object. any concert or co-operation among those who ing the first object. A contrary course of conpursue it? Is it so unlike all other avocations duct, if pursued by all the nations of the earth, would evidently have rendered the whole habita onal knowledge.

2. Our soil and our Intellects—We must give of each individual, engaged in it, will suffice of ble globe itself, in the course of a few centuries, inadequate to the support of its inhabitants. To improve our agriculture, therefore, is a moral dunicious notion, than the belief, that each man, for himself, can study and practice any, or all the occupation. In a political point of view, there rity for regular demand and supply.

4. The Congress of the United States—Would they give Agriculture more of their works, and seclusion from his agricultural brethren, as if he seclusion from his agricultural brethren, as if he frequently mixed with them, and sought to realize all the benefits of their experience, as well as of their experience, as well as of this countries with more pleasing anticipations of his country's prosperity and happiness, than The best pioneers, for liberty, knowledge, and at least, the pitiable folly of those who are far too the prospect of realizing such a state of society, as an agricultural people may form and maintain, if they will only avail themselves of all the means which are naturally connected with, and grow out of their pursuits, for the promotion of knowledge and virtue; for the security and beneficent use of property; and for the permanent enjoyment of the highest degree of earthly fellcity, which social man is capable of attaining.-This, my friends, is no romantic vision; no picture, the coloring of which is borrowed from an imagination, too sanguine, in regard to what may be done, provided only proper means are used, and assiduously applied. It would occupy more of our time than we can now spare, to attempt even a brief enumeration of these means. Let it suffice for the present, that I earnestly entreat you to turn your attention oftener to the objects at which I have merely hinted. There is nothing can afford us ampler scope for improving reflec-tion, nor any thing in which our temporal interests are more deeply concerned.

Although the foregoing speculations may not appear to have any immediate connexion with the purposes of our present meeting, they have been suggested by it; and as long as I have the honor to be connected with this society, I shall ever deem it my duty, to press similar topics up-

attempts to legislate them into mere "hewers of wood and drawers of water." Not that I mean to charge the authors of these acts with design-ing such an effect; but if it be really produced,

may ised, more empt Let treat jects hing flecnterr not with have the. shall uitaexhibitions; as well as to suggest a few hints, in relation to the feelings and views of those who attend them-either as mere spectators, contributors, or competitors for distinction.

We all well know the slow progress made by agricultural improvements, and the time which always elapses, before they get into general use. Our scepticism, in this respect, exceeds that even of St. Thomas himself; for we believe nothing stance of this fact, as any that I have ever known. The two first ever brought to this town, remained in the stable yard of the Indian Queen Tavern nearly a year, before any one would even tle or nothing, because we pay for it after months, and often years of delay, in some kind of agricultural product—or, because, as it constitutes to suggest a few hints, for the consideration of an item in that unlucky thing called a black-those who mean to compete for the premiums smith's account, it is never paid for at all. There which we have already offered. smith's account, it is never paid for at all. There is so wide a difference between this method of obtaining our agricultural implements, and paying what is emphatically called "actual cash" for them; that the Solomons of our tribe, who are never surprised into the juvenile indiscretion of being the first to try a new thing—especially if it comes from a distance, and "costs money;" it comes from a distance, and "costs money;" it comes from a distance, and "costs money; force, be inclined to question the correctness of shaking their wise heads at, and consigning to ruin the man who dares to violate this cardinal maxim of their rural economy. Nothing is better calculated to banish these ridiculous prejudices; and nothing more facilitates the general adoption of agricultural implements, of every kind, than the frequent recurrence of spectacles of a similar character to the present. For, on rather of those inventions, which mechanical skill and

may aid in illustrating the relative importance of the agricultural portion of our people, as a component, and most material part of our great body politic; in awakening sufficient vigilance, to guard politic; in awakening sufficient vigilance, to guard sainst encroachment on their rights; and in against encroachment on their rights; and in the such as live next door to us. That mind has necessary them more sensitive of the too frequent very et been formed, I believe, which could bear making all due allowances for their respective making all due allowances for the due to the due to the due to the making all due allowances for the due to the due to the due to the due to the d terially impaired by it. Another advantage, and tee of any design to thwart their particular efforts by no means the smallest, evidently resulting to gain the prizes at which they have aimed. I from such associations, is, that we learn to apprefeel the more solicitous on this subject from my the purity of their motives would be but a poor alleviation of the evil.

Let me now solicit your attention, for a few minutes, to the particular objects of our present meeting; and to an endeavor, briefly to point out some of the many advantages resulting from such some of the purity of the capabilities of our art, when anxious wish that in this our first attempt of the capabilities of our art, when anxious wish that in this our first attempt of the solicitous on this subject from my anxious appreciation of our form when anxious solicit tous on this subject from my anxious anxious wish that in this our first attempt of the solicitous on this subject from my anxious anxious solicit when anxious solicit tous on this subject from my anxious anxious solicit tous of what can be kind, no circumstance should occur, either to effected by those who follow it assiduously, under produce disagreement among ourselves; or to the influence of those powerful, because voluntative the slightest obstacle in the way of our further tous solicit tous on this subject from my anxious solicit tous of what can be kind, no circumstance should occur, either to effected by those who follow it assiduously, under produce disagreement among ourselves; or to our further tous with the capabilities of our art, when anxious should be tought to the solicity of the capabilities of our art, when anxious should be tought to the slight tous of the capabilities of our art to the produce estimate more highly the power, resources, and correctly: But the same thing may possibly hap-honorable character of agricultural pursuits, in pen here, which I see by the public Journals has comparison with any other, instead of undervataken place in one of our sister states; and I luing them, as far too many of us appear to do. Men, in fact, must respect themselves and their time. The case alluded to, is one of an indiviprofession, to obtain the respect of others. And dual, evidently interested, coming forward to arunless our agricultural people evince their re-raign either the judgment, or the justice, or both gard for their own occupation, by always assert-ing the rank to which they have a just claim, in ested, who were selected by one of our sister sothe great scale of national interest, they may cieties to form a committee of premiums. This

then a resident here, had not boldly resolved, at suggest, that, if they notice any thing which falls only be an insulated, and single mistake, unacevery risk, to achieve the perilous adventure of making the first trial. Even after he had demonstrated the merit of this plough, I dare say it was nearly ten years, before it was generally used in all the contiguous parts of the country. Nearly a similar fate has attended those superior was already diffused itself. In one year leads to so the country was may hope for such an accession of such as I sincerely trust, with feelings are some was may hope for such an accession of such as a superior of such as a Nearly a similar fate has attended those superior ploughs, which have been slowly superceding the Carey. One principal reason, perhaps, of this may be, that after our cobbling Smiths once get two dollars,) as will considerably augment the into a way of generally making a new agricultural simplement, according to their fashion, which into a way of generally resembles almost any thing better than the article designed to be imitated; a common prevails, that this implement costs us litter or nothing, because we pay for it after months.

Fredericksburg.

And now, before I conclude, I must make free

ble occasion. If they serve no other end, they ingenuity have devised for our use; and of which, cannot expect those who fail to obtain rewards we either might not hear for years; or if hearing, to be equally pleased with those who gain them; the agricultural portion of our people, as a component, and most material part of our great body as many do, to our own farms, nearly secluded for our present and genuine friends that we near—and require not only to see, and to feel, before we give any credit to what we are told; but rarely then, act immediately upon our belief. The History of the Carey or Dagon Plough among us, furnishes as remarkable an instance of philosophic fact, as any that I have a seed on national interest, they may credit to form a committee of premiums. This count with certainty, upon being degraded, not being a common cause to all agricultural societies, I must take the liberty to offer one or two own.

As to the feelings and views of those who at-As to the feelings and views of those who attend such exhibitions as the present, in the character either of spectators, contributors, or competitors for premiums, I will now offer a few remarks. Of the first, I shall only say, that I take it for granted, they have come well disposed to with any individual who complains of what he onvery nearly a year, before any one would even try them. During all this time, they lay the objects of doubt and cunning suspicion, to all the knowing ones, each fearing to meddle with them, lest he should render himself a mark of ridicule to the rest, for putting any faith in so ill-looking a tool. And there probably they would have continued for years, if an enterprising Yankee, then a resident here, had not boldly resolved, at suggest, that, if they notice any thing which falls only be an insulated, and single mistake, unactive risk, to achieve the perilous adventure of very short of their expectations, that I take right decisions in the end, will never take part try them. During all this time, they lay the form come well disposed to with an end, will never take part try them. During all this time, they have come well disposed to with an end, will never take part try them. During all this time, they have come well disposed to with an end, will never take part try them. During all this time, they have come well disposed to with an end, will never take part try them. During all this time, they have come well disposed to with the disposed to the humble effort made to inter-ly conceives to be an injury, and that to himself alone, in opposition to the decision of numerous and obviously impartial arbiters, who are so it creumstanced, as to have no possible interest, ly trust, that we all think much alike on the either direct, remote, or contingent in deciding our institution, yet I cannot forbear to against him. At the worst, such a decision on only be an insulated, and single mistake, unactive try them. During all this time, they have conceives to be an injury, and that to himself with the onceives to be an injury, and that to himself the onceives to be an injury, and that to himself the onceives to be an injury, and that to himself the onceives to be an injury, and that to himself the onceives to be an injury, and that to himself the onceives to be an injury, and that to himself the onceives to be an injury, and

LETTER III. ON THE POOR LAWS.

SIR-I have employed more time, and been

sistence. Where the whole produce of the lands second and third classes in society become then If they were wise, if they would weigh well and labour of a nation are more than sufficient the lowest, and as the same causes continue to what they do, the arguments in this letter, for the support of its inhabitants, food and the operate, are also extinguished. But as in all pressed home, would abolish the Poor Laws. other necessaries of life being readily obtained, countries which have been long settled, the rich But they will not listen, they will not learn, the every impediment to the gratification of the constant and universal desire of procreation is re- evident that the number of those who can mar- miseries of others cannot warn them, and the stant and universal desire of procreation is rewident that the number of those who can marmiseries of others cannot warn them, and the

I remain yours, &c. LUCIUS.

CIVIL ENGINEERING.

There is a species of talent wanting in this country, which is as rare as it is valuable. We confess our own want of it, and we most sincerely regret it, because it disables us from forming any satisfactory opinion upon those great public improvements on which hundreds, and hundreds of thousands of the public money are annually expended. We mean the talent of Civil Engineering. The best mode of clearing and improving our rivers (taking into account the present and probable situation of the country some fifty years hence) is one of those problems, which cannot be too seriously considered; because an error in this may cost the public an immense sum of money. Few people are qualified to discuss itstill fewer, to put into execution all the details of a good scheme, which they devised. He, who has the necessary talents for it, ought to be well child born when no other person ceased to consume sequence of having added to, but of having di-food, or whose parents were unable to procure vided the common stock of wealth; and thus rewarded. The salary ought to be good; and is and so scarce. We have sometimes wished, that a competent professor would establish a school in some central and eligible situation in the U. States, for the purpose of teaching the science on proper principles. We have men to teach us the elements of gunnery and fortification-others, to teach architecture, by practice at least, if not by theory-and yet the art of civil engineering which is so important to this young and thriving

country, is left almost to chance medley.

At all events a small library, consisting of the best approved authors, both theoretical and prac tical, American and foreign, ought to be attached to the Virginia Board of Public Works.

We conclude these hasty remarks by calling to the reader's attention the advertisement of our Secretary, to the Board of Public Works, A Civil Engineer, in place of Mr. Moore, deceased, is wanted. This situation is worthy of the attention of those, who are properly qualified.

Edit. Richmond Enq.

SENNA.

HISTORY.—It grows principally in Upper Egypt, from whence the leaves are brought, dried and picked from the stalks, to Alexandria dried and picked from the stalks, to Alexandria in Egypt, and thence imported into Europe.

As much injury is done in barns to the different kinds of grain, by these insects, I wish the society to devote some attention to the most and not a full inch in length, of a lively yellowish green colour, a faint, not very disagreavening their ravages. I have endeavoured for lowing green colour, a faint, not very disagreavening their ravages. I have endeavoured for laste. Some inferior sorts are brought from other habits, and am willing to state the result of my places; these may be easily distinguished by conclusions, hoping it may occasion, from some var, (or what is commonly termed slobbering)

which, if brought into notice, might be made to supply the place of imported articles, for which large sums are now sent abroad, and we beg to recommend this important branch of rural economy, to our country practitioners of medicine—who are for the most part enquiring, and therefore good farmers.

Edit. Am. Far. ses large enough to purge.

PREPARATIONS .- INFUSION OF SENNA.

Take of Senna, an ounce and a half;

ginger, powdered one drachm;
boiling distilled water, one pint:
Macerate them for an hour in a covered vessel, and strain the liquor when cold.-

Take of Senna, three drachms;

lesser cardamon seeds, husked and bruised, half a drachm-

boiling water, as much as will yield a filtered infusion of six ounces:—
Digest for an hour and filter when cold.

SENNA; OR EGYPTIAN CASSIA.

pared at one time by the London college, is to hemp, that a few layers of it, spread among the grain, at the time of putting it in the barn, four feet, resembling a shrub, and sending out clert dose. It is of advantage that it should be bern of the society, and others are possessed of the society, and others are possessed of the society. hollow woody stems. Leaves in alternate or-used fresh prepared, as it is apt to spoil very der, and compound, composed of several pair quickly.

THE MEANS OF DESTROYING THEM.

FROM THE WEST CHESTER REPUBLICAN.

ly application be made to us. The best important information. I beported senna, usually sells at 40 or 50 cts. per ed, from Mocha; or larger, broader, and round lib. The Senna of our own country is to be found in the shops; and a neighbour tells me that he has a very fine parcel, which he has not the shops in the shops in the shops and a neighbour tells me that he has a very fine parcel, which he has not the shops in doubt, teaches them at the commencement of of the soil shall produce, and offer a fit substitic, operating mildly, and yet effectually; and lie secure, and where they will be somewhat tute for imported articles.

MEDICAL USE.—Senha is a very useful catharcold weather, to seek a retreat where they may lie secure, and where they will be somewhat the for imported articles.

Had they remain-The extract which is here subjoined from sioning the ill consequences which too frequent- ed in the mow, on threshing the grain, they be-Thornton's Family Herbal, shows that there are ly follow the exhibition of the stronger puring in a dormant state, would probably be desseveral varieties of Senna—we know not with ges. The only inconveniences complained of troyed. About the middle of the 5th month, which the American Senna corresponds, or in this drug, are its being apt to gripe, and May, they begin to travel, crawling up the walls, whether it differs in colour or shape from them its nauseous flavour. These are best obviated by adding to the grain be in the barn, they find it; and I have Senna some aromatic substance, as ginger, cin-seen as many as eight or ten on one grain of pondent, at Charleston, proves that the variety continued in South Carolina, of which he has sent us the seed, is equally valuable, since actual trial has proved it so, and it will be seen in page 216, in a letter from Abel Seymour, tent of about a drachm; but it is rather too bulky, apprehend, deposite their eggs in the grain, that Sanna grows on the margin of our right of our right of the seed. Esq. that Senna grows on the margin of our ri-vers spontaneously, and in sufficient abundance doses, and to take one half at night, and the probably, to supply the United States. There other in the morning. It is more conveniently are doubtless many indigenous productions, given in the form of infusion, which is gene-which if herealth into action might be made.

> sliced apples with sugar with it, when it will be weeks it will be very much eaten, and numreadily taken. Senna ought never to be ordered bers of weevils in the bags. Having thus brief-in decoction, Gren says, because it becomes ly stated my opinion of their habits, I will sugperfectly inert, from the total dissipation of the gest a few propositions for destroying them nauseous and volatile principle on which its purgative effects depend. The tincture, on acbe to stack the grain out for one or two years, count of the menstruum, cannot be given in do- and keep all kinds of it from laying in the barn, during the summer season, by this means they would be deprived of food and of a suitable

place to deposite their young.

Many of them may be destroyed by having no grain in the barn from the time they leave their winter retreat, till harvest; except about a double handful of Indian corn in a place, and in several different places. Numbers of them will go to these heaps for food, then about once in two days to riddle them in some clean place with a wheat riddle, the insects will fall through, which may be gathered up and thrown into the fire. Another method is to leave a little straw in the stables at this season, and before harvest Digest for an hour and filter when cold.

This is a well contrived purgative infusion, the aromatic correcting the drastic effects of the Senna. But the quantity ordered to be prepared at one time by the London college, is bers of the society, and others are possessed of facts on this subject which would be highly interesting to those who are troubled with these insects about their barns. It is hoped they will be induced, through the medium of the society or otherwise, to make them public, as it might be the means of saving many bushels of grain annually for the use of the community. ISAAC SHARPLESS.

veral experiments, I am induced to believe that hog to the plank, passing the strap close behind have decoyed away his birds; and this supposition is rather confirmed as they appear occasioned by a rapid fermentation or decomposition of the food in the stomach; when an abundant discharge of this kind takes place, the &c. one drew the hind legs as far back as possihorse may truly be called diseased; and in that ble without injury to the hog, the other securcase fermentation may go on in the stomach, for ed the head and fore-feet. The hair was close-it cannot, when an animal is in health, although ly trimmed with a pair of large scissors from the process of digestion not more than half a cen-the hip bone, down towards the belly, then

PIGEONS; a mode of Domesticating them.

MR. SKINNER,

I observe that "a lover of squabs" is in a sad
plight, and that all his "loves" desert him
when they can flap their pinions. In this predicament he asks your readers to teach him how slobbering commenced; the frost has now checked its growth and prevented the disease.

I have sometimes given plenty of salt with very good success; it assists digestion, and prevents fermentation; second crop clover, well salted when put in the barn, lessens its powers in proding on a farm, and having a "love" like unto since, and selected by a good judge, as the exyour correspondent, the same measures were adopted to ensure a supply of squabs—whether I had heard, or read, that salt was a favourite condiment of that bird is not now recollected; to it was, that some how I had derived the incommands. The growth of it, therefore, formation, that if they at discretion, had account to the agricultural cess to salt, it would not only have the effect to add manufacturing interests. These bucks are of attach your own pigeons to their homes, but the mering race of sheen, but improved. They attach your own pigeons to their homes, but the merino race of sheep, but improved. They would also attract your neighbour's. Be assured are remarkable for the fineness, delicate soft-that the hope of accomplishing the latter, did ness, and singular uniformity of their fleeces, not actuate me to test the truth of my informa-tion—yet the essay was made in the following the proprietors are entitled to a meed of thanks. manner-some stiff clay, free from sand or grit, was procured, and being well kneaded up with salt water, and a liberal portion of salt grains, it was formed into a conical shape, some-what resembling a sugar loaf, though less than the smallest sized loaves. After it was made perfectly dry by exposure to the sun and air, and sheltered during the night and wet weather, standby dish, some of them were generally en- that is very wholsom, and in use amongst the gaged in picking at it. Certain it is, my pigeons were sufficiently domesticated, whether for were sufficiently domesticated, whether for preferably to Oyl Olive, being not so apt to make this cause, I cannot say—neither can I assert those who eat it break out into scabbs as they that this keeping open house had the effect to do in many parts of Italy. This would grow very a foot wide, one end of which was raised, four that this keeping open house had the effect to feet from the ground, the hog was laid on its right side, its hind feet towards the upper end of the plank, he stood at its back. With a strap ble that some of your complainant's neighbours, the plank, he stood at its back.

If these sugges-tions should have the effect to relieve your cor-

TO THE EDITOR OF THE AMERICAN FARMER.

SQUABS.

Your correspondent, who is a "Lover of Squabs," wishes to know how he can prevent his pigeons from leaving him. I advise him, in the first place, to prevent their being disturbed by rats, and then rub some assafætida inside of the boxes.

SAXON SHEEP.

We are pleased to learn, as we do from the following notice, that two choice bucks of this breed have been recently imported, to improve the flocks of fine woolled sheep in Massachusetts; and we hope that some choice Ewes, of the same breed, may be soon introduced, to multiply the opportunities of realizing the advantages that might be derived from this cross.

THE AMERICAN GARDENER;

Or a Treatise on the Situation, Soil, Fencing and Laying-Out of Gardens; on the making and Managing of Hot Beds and Green-Hous-es; and on the Propagation and Cultivation of the several sorts of Vegetables, Herbs, Fruits and Flowers.—By WILLIAM COB-

"I went by the field of the Slothful and by "the vineyard of the man void of understand-"ing: and lo! it was all grown over with thorns, "and nettles covered the face thereof, and the "stone-wall thereof was broken down. Then "I saw and considered it well: I looked upon

"it and received instruction."

Proverbs: Chap. xxiv. Ver. 30.

1. The proper uses of a Preface appear to be, to give the reader information, which may be useful, during the perusal of the work to which it is prefixed, to explain the nature and of Carolina, at least, object of the work; to point out the method of the arrangement of its several parts; and, in 5. I have divided the for the task the reader is entering upon; which

2. As to the nature of the work, it is, I hope, pretty clearly stated in the Title Page. The object evidently is to cause the art of gardening to be better understood and practised than it useful, and that tend to profit and to the preservation of health, without which latter, life is not worth having. It is incredible to those, who have not had occasion to observe the fact, how large a part of the sustenance of a country-labourer's family, in England, comes out of his little garden. The labourers of England are distinguished from those of other countries by several striking peculiarities, but, by no one are they so strongly distinguished as by their fondness of their gardens, and by the diligence, care and taste, which they show in the management of them. The reproach which Solomon, in the words of my motto, affixes on the slothing preference to one, which, though more strictful and ignorant husbandman, they seem to have constantly in their minds; and to be constantly on the watch to prevent it from applying to themselves. Poverty may apologize for a dirty dress or an unshaven face; men may be negligent of their persons; but the sentence of the whole nation is, that he, who is a sloven in his garden, is a sloven indeed. The inside of a labourer's house, his habits, his qualities as a workman, and almost his morality, may be judged of from the appearance of his garden. If that be neglected, he is, nine times out of ten, a sluggard or a drunkard, or both.

food; as we generally call these only by the name of vegetables, I have chosen that word that word in preference to one, which, though more stricting preference to one, w care and taste, which they show in the mana drunkard, or both.

3. It seems, at first sight, very odd that this

good garden supplies so large a part of what is ought to be done there. With this clearly borne consumed by a family, and keeps supplying it all the year round too, there are many farmers even in England, who grudge even a wheelbarrow full of manure that is bestowed on the garden. den. To remove this neglect as to gardening 8. Those persons, who perform their garden help-mate to the Farm.

Green-Houses, may read the part treating of them, or leave it unread, just as they please; but, I think, that it will not require much to be

short, to afford the means of due preparation The first Chapter treats of the Situation, Soil, gardener. I selected handy and clear-headed of the task ters treat of the raising and managing of the several plants, each under its particular name, the power and the mischief of pretended garclassed under the heads, Vegetables, and Herbs; deners. Tell a gentleman, that this is wrong, now is in America; and, very tew persons will Fruits; Flowers. In each of these last three deny, that there is, in this case, plenty of room Chapters, I have, in arranging my matter, folden, and he instantly and half-angrily replies, deny, that there is, in this case, plenty of room for improvement. America has soil and climate lowed the Alphabetical Order of the names of far surpassing those of England; and yet she is surprisingly deficient in variety as well as quality tend to make the work of fargranger ment must naturally tend to make the work of mous expense, had got two or three poor little melons, while I at hardly any expense at all, had large quantities of very fine ones: "That work must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary, and, as the utility of the lower must be necessary. That may be," said I once to a friend, who, at an enormous expense, had got two or three poor little melons, while I at hardly any expense at all, had large quantities of very fine ones: "That may be," said I, "for skill may consist in getting with which the definition of the matter in that the instantly and native must have must be instantly and native must have must be instantly and native must have must be metally and the instantly and native must have must be metally and the instantly and native must have must be metally and native must have must have must be must have must h referred to, there are two Indexes at the end, one, of the names of the several plants, and, not a desire to be deceived, that produces this the other, of the matters generally. For the species of perverseness: it is a desire not to be same reason, I have numbered the paragraphs thought foolish. The gentleman has chosen the throughout the work. A more proper term gardener; and, the reason why he stickles for might have been found than that of Vegetables, him is, that, if he allow the gardener to be a seeing, that, strictly speaking, that word applies to all things that grow from the earth. which we use, in their natural shape, as human food; as we generally call these only by the freely.

nation to a gold watch set with diamonds.

3. It seems, at first sight, very odd that this taste for gardening should not have been preserved in America; but, it is accounted for by reflecting, that, where land is abundant, attachment and even attention to small spots wear away. To desire to possess land is an universal desire; and vanity makes us prefer quantity to quality. You may prove as clearly as daylight, that it is better, in certain cases, to possess one acre than a hundred; but where do you find the man that prefers the one acre? When large parcels of land are undertaken to be cultivated, that I am supposing myself at, or near, the City of the control of this preface, expressing my hope, that this work may tend to the increasing, in some degree, of a taste for gardening in America. It is a source of much greater profit than is generally imagined; and vanity makes us prefer quantity to the country. I, therefore, for the most part, attion, it is one of the most rational and most conducive to health. It is a pursuit, not only states of the weather, rather than to dates. When I make no particular mention as to times any art or science. It tends to turn the minds of the year, or month, it is to be understood, frivolous or vicious nature. It is indulged at 7. The territory of the United States includes 11. I cannot help, in conclusion of this pre-

CHAPTER I.

On the Situation, Soil, Fencing, and Laying-out of Gardens. SITUATION.

formed; and, therefore, it is an essential part of the earth out of a watering-pot in a month. my duty to point out what situations are best, as well with respect to the aspect as to the other circumstances.

as possible; because, if the slope be considerable, to be found. The best is, learn of several feet the whole that you have put into the trench, you the heavy rains do great injury, by washing away deep with a bed of lime-stone, sand-stone, or have another clean trench two feet wide and two the soil. However, it is not always in our power sand, below. But, we must take what we find or, deep. You thus proceed, till the whole of your to choose a level spot; but, if there be a slope in rather what we happen to have. If we have a garden-ground be trenched: and then it will the ground, it ought, if possible, to be towards choice, we ought to take that which comes near-have been cleanly turned over to the depth of two the South. For, though such a direction adds to est to perfection, and, if we possibly can, we feet. the points between North and West. After all,

a distance of thirty or forty yards. For the shade could exchange it for some other early in June; calculation. There is no point of greater importance than their roots a great deal more injurious, to every plant growing within the to be burnt up in summer, if you have the be-is preferable, in many cases, to rich ground influence of those roots. It is a common but very nefit of a gravelly bottom in the spring. erroneous notion, in England, that the trees, which grow in the hedges that divide the fields, do injury by their shade only. I had a field of transplanted Ruta Baga, in the hedge on the North West side of which there were five large spreading eak-trees, at some distance from each you must e'en hammer your tools to pieces plants of almost any kind that stand for the spreading eak-trees, at some distance from each other. Opposite each of these trees, which could amongst the stones; for it has been amply proved space of three months in top soil of the same of the Ruta Baga, in nearly a semi-circular form, in which the plants never grew to any size, though those in all the rest of the field were so though those in all the rest of the field were so fine as to draw people from a great distance to look at them. One gentleman, who came out of that, in a country where men have had to choose, difference is so great, that there is room for no Sussey, and who had been a farmer all his life. time, was struck with the sight of these semi-circles; and, looking over the hedge, into a field steril. We must suppose the contrary, and, than the roots of the plant penetrate. But, in of wheat, which had a ditch between it and the upon that supposition we ought to proceed. hedge, and seeing that the wheat, though shaded by the trees, was very little affected by them, he discovered, that it was the roots and not the branches that produced the mischief. The ditch, which had been for ages in the same place, had prevented the roots of the trees from going into the field where the wheat was growing. The ground where the Ruta Baga was growing had been well ploughed and manured; and the plants had not been in the ground more than three months; yet, such was the power of the roots of the trees, and so quickly did it operate, that it almost wholly destroyed the Ruta Baga that stood within its reach. Grass, which matts the ground all over with its roots, and does not degrand much food from any depth, does not suffer man.

The discovered, that it was the roots and not the may be done by ploughing and harrowing, until the ground at top, be perfectly clean; and then, the ground assist us, we should find the roots a great deal longer, and the roots a great deal longer, and the roots are deal longer, and the roots are deal longer, the roots are medical longer. The ground at top, b mand much food from any depth, does not suffer man. much from the roots of trees; but, every other plant does. A Kitchen Garden should, there-fore, have no large trees near it. In the spring preparing the ground. But, this is not all that on a brick pavement with earth laid upon it to and fall tall trees do great harm even by their ought to be done; and it is proper to give di-shade, which robs the garden of the early and the rections for the best way of doing this and every live and thrive in such a state, while it will do

much in other respects, to make a garden near to all along, two feet wide and two feet deep. You running water, and especially to water that may throw the earth out on the side away from the be turned into the garden, the advantage ought garden that is to be. You shovel out the bottom to be profited of; but as to watering with a wa-clean, and make the sides of the trench as nearly tering hot, it is seldom of much use, and it can-perpendicular as possible. Thus you have a not be practised upon a large scale. It is better clean open trench, running, all along one end of to trust to judicious tillage and to the dews and your garden-ground. You then take another 12. Those who have gardens already formed and planted, have of course, not the situation to cannot be furnished, to any extent, by the water-that this new piece contains into the trench, choose. But, I as a suppose, that new gardens ing-pot. A man will raise more moisture, with taking off the top of the new two feet wide, and will, in a country at this, be continually to be a hoe or a spade, in a day, than he can pour on turning that top down into the bottom of the

SOIL.

it may not be in our power to have a level spot, heaviest wheat grows in land with a bottom of garden to contain an acre, and the labourer to nor even a spot nearly level; and then we must clay; but if there be clay within even six feet of earn a dollar a day, the cost of this operation the surface, there will be a coldness in the land, will, of course, be forty dollars; which, per-which will, in spite of all you can do, keep your haps, would be twenty dollars above the expense garden. Of ornamental Gardening I shall speak spring crops a week or ten days behind those of the various ploughings and harrowings, nelittle in the Chapter on Flowers. From a upon land which has not a bottom of clay. Gravel cessary in the other way; but, the difference in Kitchen-Garden all large trees ought to be kept at is warm, and, it would be very desirable, if you the value of the two operations is beyond all

Sussex, and who had been a farmer all his life- and have still to choose, they will have built, and comparison. It is a notion with some persons,

by the trees, was very little affected by them, he the next thing is to prepare the ground. This bage, for instance, we see no roots more than a

At one end of the piece of ground, intended for 15. If it be practicable, without sacrificing too the garden, you make, with a spade, a trench, trench, and then taking the remainder of the earth of the new two feet, and placing it on the top of the earth just turned into the bottom of imstances.

16. The plants, which grow in a garden, pre- the trench. Thus, when you have again should be as nearly on a level fer, like most other plants, the best soil that is velled out the bottom, and put it on the top of

the heat in summer, this is more than coun-lought to reject clay and gravel, not only as a 21. As to the expense of this preparatory terbalanced by the earliness which it causes in the top-soil, but as a bottom soil, however great operation, a man that knows how to use a spade, spring. By all means avoid an inclination to-their distance from the surface. See paragraph will trench four rod in a day very easily in the wards the North, or West, and towards any of 109. 17. Oak-trees love clay, and the finest and ber if the ground be not frozen. Supposing the with shallow tillage; and when the ground has 18. If the land, where you like to have a been deeply moved once, it feels the benefit for on that supposition we ought to proceed. the first place, the roots go much deeper than 19. Having fixed upon the spot for the garden, we generally suppose. When we hull up a cabthe plants are affected by the unmoved ground 20. This is as much as I shall, probably, be being near at hand. If this were not the case, parting rays of the sun. It is therefore, on all thing else. The best way is, then, to trench the very well in ground along side the payement,

though moved only a foot deep. Plants require

will rill do remember, that he is about to do that, the effects into it. of which are to be felt for ages. There is, however, different from that described in paragraph 20.

23. Your first trench must be opened in the retain, moisture. manner described in that paragraph; but you must not then proceed to turn the top of the next This being the case, take a foot deep of the next off from this, and throw it on the top of the earth that you have just turned into the first trench; and then, where that first trench was there will be earth two feet deep; the bad soil at bottom and the good soil at top. Then you go on regularly. The bottom foot of the fourth two-feet wide piece you turn into the bottom of the second trench, and the top foot of the third two feet wide piece you throw on the top of the earth which is at the bottom of the second trench. And, thus, when you have done, you will have moved all your ground two feet deep, and will have the bad soil at bottom and the good at top.

ter IV.

25. It must be observed, however, that, though the soil be good in its nature down to two feet deep, that which comes to the top in the first mode of trenching, will not be, immediately, so good for use, as the soil which has been at top for ages. It is, in such a case, of great advantage to place the old top soil at the bottom; or part of such a heap, might at all times be depth, the plants and trees thrive and heap are depth, the plants and trees thrive and heap are depth. The plants and trees thrive and heap are depth, the plants and trees thrive and heap are depth. The plants and trees thrive and heap are depth. The plants and trees thrive and heap are depth. The plants and trees thrive and heap are depth. The plants and trees thrive and heap are depth. The plants and trees thrive and heap are depth. The plants and trees thrive and heap are depth. The plants and trees thrive and heap are depth. The plants are developed as the time in seven days more. And but the first time you will have forty cart loads of manure, equal in strength to twenty of yard dung, and a vast deal better for a garden, or, indeed, for any other land. It is not expensive to obtain this sort of manure; and such a heap, where the plants are decoming dung, and a vast deal better for a garden, or, indeed, for any other land. It is not expensive to obtain this sort of manure; and such a heap, where the plants are decoming dung, and a vast deal better for a garden, or, indeed, for any other land. It is not expensive to obtain this sort of manure; and such a heap, where the plants are decoming dung, and a vast deal better for a garden, or, indeed, for any other land. It is not expensive to obtain this sort of manure; and such a heap, where the plants are decoming dung, and a vast deal better for a garden, or, indeed, for any other land. It is not expensive to dung, and a vast deal better for a garden, or, indeed, for any other land. It is not expensive to dung, and a vast deal better for a garden, or, indeed, for any other land, or indeed, for any other land, or indeed, for any other land depth, the plants and trees thrive and bear sur-prisingly. But, then, the new top soil must be exceedingly well worked and well and judiciously manured, in order to make it equal to the old top manured, in order to make it equal to the old top soil; which object is, however, very soon accomplished, if the proper means be made use

26. The ground being trenched, in October, AGRICULTURAL SOCIETIES, AND PROFESSORa communication with, and an assistance from, ought to be well manured at toh with good well-beneath as well as from above, in order to give rotted dung, or with soah-boiler's ashes, or some them vigour and fecundity. Plants will live and other good manure; and this might be ploughed, will grow to a certain extent in earthen hots, or dug, in shallowly. Before the frost is gone in or in boxes made of wood; but, there must be the spring, another good coat of manure should holes in the bottom of both, or the plants will be put on; well-rotted manure from the yard; holes in the bottom of both, or the plants will be put on; well-rotted manure from the yard; condition of life. The spirit and feelings which die. See paragraphs 108 and 109.

22. It is, therefore, of the greatest importance, that the ground be moved to a good depth, will be realized the ground tance, that the ground be moved to a good depth, it will be realized the ground the plough are now taught the ground the plants which is will be realized the plough are now taught the plants will be realized the plants which they are daily infusing into the mass of society, will be productive of lasting and universal benefits. The followers of the plough are now taught and, he who is about to make a garden should it will bear almost any thing that can be put

27. Thus will the ground be prepared; and here one objection to trenching in certain cases. The I close my directions with regard to the nature soil may not only not be good to the depth of two and preparation of the soil. But, it seems nefeet, but it may be bad long before you come to cessary to add a few words on the subject of masons as Farmers, to fit them for their employthat depth; and, in this case, the trenching, in nures as adapted to a garden. It is generally ment, as youth are prepared to follow other purputting the good soil at bottom, might bring a hungry sand, or even a gravel or clay to the top, which must not be done by any means; for, even in the case of trees, they would perish, or become stunted, because their roots would not find their stunted, because their roots would not find their of that sort of manure, compared to what they use of their time than heretofore. way from the bad soil to the good. In such cases are when raised with the aid of ashes, lime, rags, the top soil must, in the trenching, be kept at the and composts. And, besides, dung, in hot soils fits, which this nation may realise from the juditoh; and, in order to effect this, your mode of and hot climates, adds to the heat; while ashes, clous direction of this animating spirit, that no proceeding, in the trenching, must be somewhat lime, rags and composts do not; but, on the pervades the whole extent of our country; and contrary, they attract, and cause the earth to

28. All the ground in a garden ought always two feet into the bottom of the trench. Let us suppose, now, that you have your first trench, two be well manured once every year. Perhaps it will feet wide as before directed, open and clean, scarcely ever be convenient to any one to ma-

> 29. A great deal more is done by the fermentation of manures than people generally ima-gine. In the month of June take twenty cart loads of earth, which has been shovelled off the surface of a grassy lane, or by a road side, or round about barns, stables, and the like. Lay these twenty loads about a foot thick on some convenient spot. Go and cut up twenty good cart-loads of weeds of any sort, and lay these well shaken up, on the earth. Then cover the weeds with twenty more cart-loads of earth like the former, throwing the earth on lightly. In three days you will see the heap smoke as if on heating will take place, but less furious than the former. Turn it a second time in seven days; and a third time in seven days more. And

(To be Continued.)

SHIPS-INTERNAL IMPROVEMENTS-DOMES-TIC MANUFACTURES, &c. &c.

The happy impulse given by the formation of Agricultural Societies throughout this Union, will be felt by persons in every pursuit and condition of life. The spirit and feelings which to look upon their profession as holding the first rank among the arts, and they are incited to place more reliance upon the discoveries of science, than upon the precepts of tradition. The suits-by judicious combination of practice with theory-whilst their daughters are encouraged by the bestowment of suitable rewards upon household manufactures, to make a more productive

pervades the whole extent of our country; and when we perceive many of our intelligent and worthy citizens in every state, associating to perpetuate and direct this feeling, we cannot doubt the accomplishment of every reasonable

hope connected with the subject.

The union of five counties in Pennsylvania to afford a suitable Theatre whereon to display nure the whole garden at one time; and this is and give notoriety to improvements in Husbandtwo feet all the way along, and, for this once, burnt, is excellent manure for a garden. It has many incidents which have lately occurred to that you have already thrown out of that trench, no seeds of weeds or grass in it. A compost, cheer the friends of Agriculture. On every made of such ashes, some wood-ashes, a small hand we perceive application foot of earth left. Then you will have the bottom foot of earth left. Dig out this and turn it into the bottom of your open trench, and then the first trench will be half filled up, and you will have got your second trench open. Then go to a new two feet wide, that is the third two feet. Take the top foot deep that is the third two feet. Take the top foot deep the top foot deep that is the third two feet. Take the top foot deep that the third two feet. Take the top foot deep that the third two feet. Take the top foot deep that the third two feet. Take the top foot deep that the third two feet. In the following order, in Montgomery—Chester nothing can give the executive government so and annuities is, that for the interest of stock in the former, government is forever bound, till the principal shall have been paid off; the latter is and we are confident that it is only necessary to paid off and extinguished when the years expire lay open the plan and scheme of the system, to for which it had been granted. And as the principal shall have been paid off and extinguished when the years expire lay open the plan and scheme of the system, to for which it had been granted. And as the principal shall have been paid off and extinguished when the years expire lay open the plan and scheme of the system, to for which it had been granted. And as the principal shall have been paid off and extinguished when the years expire lay open the plan and scheme of the system, to for which it had been granted. 8. A quorum of the Society shall consist of not convince the most superficial politician of its mis-cipal vested in the annuity is sunk, a larger

ment independent of the people, and greatly increasing the public burthen of the nation.

When the minister requires a supply of mobe wanted to a certain amount, and after obtaining the vote of his minions for raising the money in that way, he gives notice in the Gazette that he will receive proposals for the loan upon a certain day. On the day appointed, the proposals are opened, and the purchaser, or rather the lender, is declared.

Though it is but seldom that one person, or one house, can take the whole loan on their own account, it is common for one person, or one firm, to bid for the whole and take in subscriptions from others to make up the sum required; and in order to suit the subscribers, the stock will consist of three per cent. consols, and of long or short annuities. The loan is usually made so that the given for the purchasers to obtain subscriptions to make up the whole sum, during the period from which the loan is agreed for to the time the last payment is made. Those who have subscribed often sell to others their share or a part of it—and it sells at a profit or a loss in proportion as the terms made with the government have been considered good or bad. Thus, if the terms have been considered good, it will bring a premium per centum, and if bad, it will be subject to a discount. When this last purchaser buys from the original subscriber the whole of what including 3 per cents. annuities, &c. it is then called omnium, which means all the different kinds of stock. And when we are told that omnium bears a preminm of 2, 3, or more per cent.: we are to understand that the whole of the stock purchased has been a good bargain for 15. It shall be the duty of the Corresponding the purchasers, and of course a bad one for the government. If the last purchaser buys from the original subscriber any particular kind of stock, say 3 per cent. consols, or annuities, (long or short,) that is called scrip, which may also bear a premium, or a discount according to the secondary purchasers are, in all respects, placed the payment of instalments, forfeitures, &c. and at the winding up, or completion of the loan, they have their names entered on the books of the bank of England, where the accounts are kept, as being the proprietors of the stock they have thus purchased.

That kind of stock called 3 per cent. consols, consists in money advanced to the government, for the payment of the interest of which the revenues of the country are pledged; or, to use technical terms, the interest becomes chargeable upon the consolidated fund-hence the abbre-

viation consols.

That kind of stock called long or short annuities, consists in money advanced to the govern-ment, for which a certain annuity is paid for a certain number of years. For 30 years, it is called a short annuity; for 60 years, it is called a long annuity. And the money is sunk, the debt becoming extinguished at the end of the period mentioned.

The difference, therefore, between consols

the interest in consols amount to.

These bills are made paythe kind of stock they wish to deal in, and also all her children, whether she be virtuous or able with interest at 5 per cent., sometimes from the day they are issued, and sometimes bearing no interest till some months after their date. Formerly, those bills were issued during the recess, and payable when sanctioned by Parliament that on which the bargain was first made.

These bills are made pay- upon a settling day, which may be a week or a bandoned, whether they be legitimate or illesticated by a solemn and irrevocable act that his fortune, other difference in price which that stock bears to other difference in price which that stock bears to other difference in price which that stock bears to other difference in price which that stock bears to other difference in price which that stock bears to other difference in price which that stock bears to other difference in price which that stock bears to other difference in price which the bargain was first made. at its next meeting. The cause of their issue was, that the funds had been exhausted, and to agrees with the seller, or the bear, for a certain the virtuous and vicious, those who became worprevent the operations of government from be-amount, say 1000% in 3 per cent. consols, sup-thy men and women, and those who turned ing retarded. And as it was well known that pose at 66 per cent. delivery to be made one scoundrels and prostitutes, should share alike the minister was always sure of a majority in week hence, and if, on that day, as appointed, the his care and support; what voice would not be Parliament, the utmost confidence was placed in exchequer and navy bills. They were, therefore, paid shortly after the meeting of Parliament. But latterly, when the resources of the country became embarrassed, instead of paying offthose bills, they were what was called funded; but hey were taken out of the hands of the bodders, and in return they obtain three per is a mere bet, of an indefinite nature, that stock he in grade appointed, the hals care and support; what voice would not be same stock can be had for 65½ per cent. then does lifted up against him as a destroyer of the most challenge of his children, an encourager of vice, and a participator of their infamy? It has often been said that a good king is the father of his subjects; we have no kings, but our laws stand business is settled without any actual transfer of for us in the place of a king. Our laws should be the father of the people, but they promise to bodders, and in return they obtain three per is a mere bet, of an indefinite nature, that stock bestow their protection and support; when noholders, and in return they obtain three per is a mere bet, of an indefinite nature, that stock bestow their protection and support, when pocent, stock. Those navy and exchequer bills, will be higher or lower on a given day; and that when floating, were called the unfunded debt; the amount of the loss or gain will be in propor-children and the bad. It is this certainty of exand to such an amount were they in circulation, tion to the rise or fall of the stock: and if there periencing the state's bounty, this indiscrimitate the true amount of the debt could never be known to the public; because, when any account and fall of the stocks depend upon the political that has filled the wards of our Poor Houses, and of the funded debt was published, the unfunded state of the country, and its relation to foreign continues daily to increase the number of our debt was unknown. In some cases the unfunded countries, an opening has been given to intrigue; and frauds, to large amounts, have been companied by having and frauds, to large amounts, have been companied by having an difference of the United States.

By means of those exchequer and navy bills, paragraphs inserted in the newspapers, both paragraphs inserted in the newspapers, both artium magister, ingenique largitor." But hungariser, ingenique largitor." But hungarisers, ingenique largitor." the minister has been enabled to obtain loans at home and abroad; and, on some occasions, ger does brighten a man's invention more without the formality of Parliamentary sanction, whole newspapers have been forged for the purtuanit arouses his bodily exertion; its effect is

and careful? Is it not the certainty of plenty which relieves the first from care, and the fear to the lower classes of society, the purse of Fortunatus. What man is there, whatever his habits may have been, however steady, industrious, prudent and economical, however great or small his fortune is, who would persevere with the same diligence and attention in improving and ration of more moderate wealth. The estates of the labouring classes do not consist in lands, slaves and money; but in health, strength and industry. The assiduous cultivation of these estates does not produce magnificent palaces, splendid apparel and sumptuous feasts; but it provides comfortable lodgings, necessary raiment, and wholesome food; thus supplying every comfort to those, to whom habit has not rendered luxuries necessaries of life. These estates, this health, strength and industry, the poor are encouraged by law, to squander in the indulgence of every vicious excess; to dissipate by lust, drunkenness. and debauchery, and to waste in inactivity and idleness, since they are positively assured that when all shall have been spent, they will be restored to every comfort of lodging, dress and food, provided without labour or trouble on their part; and more amply and more certainly provided, than they could have been by their own most indefatigable exertions in their best days. The situation of any poor man, who labours for his daily bread is much improved in respect to the real necessaries of life, by declaring himself a pauper and removing to a Poor House. And if the poor do not flock to those establishments in still greater numbers than they have done, it is not because the inducements held out by the law are not sufficiently strong; other causes, on which it has not yet produc-ed its full effect, but the operation of which is daily becoming more and more feeble, have hitherto prevented them from profiting to the utmost, by the foolish liberality of the law.—Our country is yet young; and the establishment of Poor Houses is yet a new thing among us.

Pride, shame, and the love of unrestrained liberty

Young men possessing large fortunes indulge in poverty and the seductions of the law. Pride ter. Being in that country in the year 1817, 1 deness, dissipation and extravagance, while cannot long support itself under the burthen of those in humbler stations are sober, industrious and careful? Is it not the certainty of plenty frequency of submitting to it renders it more famous frequency and discovered a new mode miliar; and even the love of liberty yields at of making Butter, and had received letters pawhich reduces the first from care, and the lear in the last of want which restrains the inclinations of the last to the gnawings of hunger, and the torture tent from the Emperor as a reward for the dislast, and fixes a curb upon their passions? Reof cold. The Poor Laws are continually underlieve them of this fear, assure them that no mismining the strength of these feelings, because time in full and successful operation. Would bit; and the law has converted an active in- into general use, particularly in the winter, it not each unhesitatingly dissipate his wealth in dustrious citizen, whose labor might have pro- would perhaps be to the advantage of those who the indulgence of a passion, or the gratification of a whim, assured that his situation could not be made worse, but might be improved, by the receipt of the second fortune, which is held in store for him; but which he cannot touch until imperious calls of hunger. Again: a poor man is the first is expended? No fund has yet been is tempted to indulge in some unnecessary exfound sufficiently great to replace the waste of perse; perhaps a piece of finery for his wife or it is heated, which can never happen in double of the second sufficiently great to replace the waste of perse; perhaps a piece of finery for his wife or it is heated, which can never happen in double found sufficiently great to replace the waste of pense; perhaps a piece of finery for his wife, or it is heated, which can never happen in double princely fortunes; but by the Poor Laws, ample more common and more dangerous still, a jug kettles, or where one is placed within the other. provision has been made for the complete resto- of spirituous liquors for himself; the dread of future want might be sufficient to check this useless and pernicious extravagance; but again, the law steps in, with its generous and wise humanity, to fix his wavering resolution by an inviolable promise, that whatever he expends in muslin for his wife, or whiskey for himself, shall be repaid him in comfortable lodging, warm clothes, and wholesome food, from the coffers of those on whom Fortune has too lavishly bestowed her smiles. Temptations like these cannot fail of their effect, the finery is bought and worn; the spirits are procured and drank. The same desires again arise, the same objections to their gratification occur, and are obviated by the same triumphant argument; till, at length, when we should have seen a respectable couple, supported by the labour of decent and affectionate children, the Poor House receives a tawdry trollop and a bloated drunkard, whose offspring, reared in idleness, and familiarized to vice, must run the same course and reach the same goal. "I can but go to the Poor House at last" is the reply constantly made to every caution against drinking, to every exhortation to industry, and to every threat of future want. In my next let-ter, I shall pursue this subject farther. I remain yours, &c.

LUCIUS.

WHEAT-from the straw of which the Leghorn Bonnets are manufactured.

In corroboration of the many proofs of effectual attention to the interests of American Agriculture, by the officers of our navy, we have just received, from a young and very meritorious officer in that service, a small parcel of the wheat, which produces the straw out of which the Leghorn Bonnets are manufactured, accompanied with an interesting account of a cruize in the Archipelago. The writer, remarks, in relation to this wheat, the manner of cultivation and the soil on which it grows, may prove useful, and go to show that many parts of our country are adapted to its culture .- Ed. Am Farm.

> "SCHOONER NONSUCH, " GIBRALTAR, August 8th, 1822.5

" Dear Sir,

"When at Florence, I obtained from our Vice-Consul, some of the wheat that produces the straw used in making Leghorn Bonnets, and have directed a small parcel to you, with a request to Mr. Sprague to forward it by the first opportunity. I saw much of this wheat growing on the road to Florence; it was seeded on barren, hilly land, and so thick as to prevent its growing large. It is pulled up by the roots, as soon as it heads—the top joints are made into small bun-dles and exposed to the sun during the day, but FROM THE NEW-YORK AMERICAN.

Sir,—Observing in your paper last evening, a serve its rich, fine colour. I have no doubt but communication from Mr. Hugh Hartshorn to J.S. it would succeed in the United States, if proper

ver failed in attempting a cure, and within five weeks. Pinch the tail throughout, if any soft place be found, slit it with a sharp knife so far as the softness extends. I know from an accurate observation, during four years, and minute in-vestigation of the practices of the best graziers, (with whom I have much to do) that such state of the tail is proof of tendency to "hollow horn." I mean that the "tail rot," as it is called by Downing, the English Cow Leech, is a symptospine, which generally produces a more fatal ma-lady, accompanied by hollowness of the horns.— A small quantity of white mucus, or serum like stuff, exudes generally from the incision.

In New England, they all cut off the tails.— I cut off the long hair, at the ends, but never remove any portion of the bone, although I do not hesitate at pushing a sharp knife through the soft parts of half a dozen calves or cows tails in a soft parts of half a dozen calves or cows ta morning. I have seen an animal on her side, which, within half an hour, was led to rise and after eat, merely by cutting off three inches of the tail. Some of the best Surgeons to whom have spoken, think that my notions are perfectly consistent with the received opinion of the connexion between the spine and tail of a quad-ruped. The remarks of some of the old Farmers of this county, excited my ridicule on this point, at first. They go so far as to assert, that the tail is injured by treading on its end when the animal makes an effort to rise-the most skilful farmers, and the most celebrated in this neighbourhood, among us fellows who do not faint at smells, cut off the hair for the reason I

have given.

I would be glad to welcome Mr. C*******
here. The finest grazing land in the Atlantic States, I think, is the alluvion on the West Bank of the River Delaware. And the best Grazing Farms could be purchased on its margin, at very moderate prices.

I have a letter from Massachusetts, saying

that Cœlebs had 52 cows at \$10 each.

LAND.

Baltimore, 4th Dec. 1822.

DEAR SIR,

In the fall of the year, plough up your ground as deep as you can, "first sprinkling your manure on the surface;" let the field lay in this state root was too bulbous, it grew, for the most part, under ground, throwing out unprofitable fibres. I have no present knowledge of the spring of the spring, then plough it again and harrow it well, to get it into a loose, mellow state: when this is described as the state of the spring of the sprin recipe—let them be kept under cover for two days and nights, then turn them into a field where they can run, produce sweat and rub themselves; if necessary, repeat this treatment. This disease sometimes attacks the fat, and the thin. I have nehills on the elevated ground, be only 12 inches apart—when your hills are thus formed, set out your plants as soon as you can. It will be a great saving to manure in the drill, which will answer every purpose. By this process, your tobacco will grow well, and when ripe will put on a yellow appearance in the field. Thus treated, it is casily kept clean, and when housed, it will cure nearly as yellow as Tobacco raised on new grounds, and the crop be more abundant than in the usual way. This method has been fully tested, and found to answer every expectation; and old grounds have been thus made to yield equal to new land, and nearly as good prices have been obtained for their produce. This being the case, as I am assured by persons who have tried it, on whom I entirely rely, the culture may be immediately very profitable to our planters, and as much so remotely, by saving timber from being wastefully cut down, as it now is, for the purpose of making vallow Tabasas. the purpose of making yellow Tobacco. The saving of timber has become an object of much importance, already in many parts of our country. I hope that this hint may spare much of what is left, and be otherwise useful.

Your's Respectfully, To John S. Skinner, Eso.

TO CURE HORSES OF THE BOTTS. Lexington, Ky. 14th Nov. 1822.

If a recipe for curing horses of the Botts, will be any acquisition to the readers of your very useful paper, you may insert the following, which I can vouch for, by most successful experiments. Indeed I do not know, nor have I heard of a case in which its application has not accomplished a

in like manner. It is recommended that the horse have no water for 24 hours after this process."

A pint of molasses, mixed with a like quanti-ty of sweet milk, will be a good substitute for salt daily in their food—once in a fortnight, half an ounce of salt petre. It must certainly sometimes molasses and milk entice the fly to quit its place. a sufficient drainage. It must certainly sometimes molasses and milk entice the fly to quit its place, happen, that shallow ditching is best, and the that it may partake of the grateful repast. VERSAILLES, Ken. March 18th, 1822. Sir-In this country there is a strong sentiment in favour of increasing the tariff and encouraging domestic manufactures, but discovering the nation much divided as to the policy of the measure, we are willing to submit to the will of the majority. Yet there is one of the staples of the Western and Southern States, which could be increased to almost any extent, and for the greater of the year, as being well suited to the introducproduction of which I feel much anxiety, to wit:
Hemp. We are certainly guilty of great folly
in suffering our market to be supplied with Rus-FARM, situated about twelve miles north of Frelower than that of Russia. We should act as inconsistently with our interests were we to encourage the importation of foreign Cotton, Tobacco and Flour, as we do by favoring that of Hemp.
For several years I turned my attention to the
raising of Hemp, and succeeded very well in it; raising of Hemp, and succeeded very well in it; but being in the possession of a considerable tract to 6 cts. per lb.—Beans, \$1 25 to 1373—Peas, of land well adapted to grazing, and finding that black eyed, 55 to 60 cts.—Clover seed, 9 to \$10—DWELL to extend the raising of Hemp, so as to make it to extend the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, would require an increase of the raising of Hemp, so as to make it an object, in my situation, which is a situation of the raising of Hemp, so as to make it an object, in my situation, which is a situation of the raising of Hemp, so as to make it an object, in my situation, which is a situation of the raising of Hemp, so as to make it an object, in my situation of the raising of Hemp, so as to make it an object, in my situation of the raising of Hemp, so as to make it an object, in my situation of the raising of Hemp, so as to make it an object, in my situation of the raising of Hemp, so as to make it an object, in my situation of the raising of Hemp, so as to make it an object, in my situation of the raising of Hemp, so as to make it an object, in the raising of Hemp, so unwilling to be taxed with, I declined the culture 65 to 70 cts.—Shad, none in market—Herrings, complete Stone Distillery, in which twenty thousand the culture of the complete stone declined the culture of the complete stone declined the culture of it as a leading crop, and turned my attention No. 1, \$3 62 per bbl.—No. 2, \$3 37 —Fine sand gallons of whiskey can be made annually with chiefly to grazing. But whilst I was engaged in salt 80 to 90 cts. per bush.—Coarse, do. 621 raising Hemp, I discovered that by securing a crop well, and keeping it one year, and then spreading it out to wret, in the usual way, I gave to it all cts.—Chickens, \$1 50 per doz.—Straw, \$11 to 12 erected. A Store House, Corn House, Smith's well, and keeping it one year, and then spreadthe qualities of the water wretted Hemp; the per ton—Hay, \$17.

Shop, a large Barn, and in short, every burning the per ton—Hay, \$17.

Maryland Tobacco—of the fine qualities, none that can be of service to the farmer or distiller, was even fairer than that of the Russia, the staple stronger, and it was entirely clear of the outer scale or bark, which prevents its absorbing the quantity of tar necessary to its presents in the market.

Maryland Topacco—of the nne quantites, none that can be of service will be found on this estate. With respect to fences, water courses, &c. it is deemed unnesorbing the quantity of tar necessary to its presents in the market.

So to 5, plenty and dull—seconds, \$1 cessary to give any account, as persons disposed to 5. Very little doing in the market. my acquaintances, and found that whenever Hemp had been kept by them over the year, the result was uniformly the same. The best way which I have found to preserve a crop of Hemp, per, wishes to make an engagement for the next is to stack it in ricks of convenient size; when year. His present employer will answer any these are as high as they can be handily made, enquiries as to his character and qualifications. project the last course or two 12 or 18 inches over the sides, so as to form caves, then top them off with rye or wheat straw, very securely. Straw which has been trodden out, I have found the most suitable. I intend raising a small crop in king, offers for sale his balance of stock, on the this way, and I will send it round to the Navy most moderate terms, consisting of Wire Sieves,

HORTICULTURE.

THE AMERICAN GARDENER;

Or a Treatise on the Situation, Soil, Fencing and Laying-Out of Gardens; on the making and Managing of Hot Beds and Green-Houses; and on the Prahagation and Cultivation of the several sorts of Vegetables, Herbs, Fruits and Flowers.—By WILLIAM COB-BETT.

(Continued from page 299.)

FENCING.

supposing the garden about to be made. Those who already have gardens, have fences. They may improve them, indeed, upon my plan; but, I am supposing the case of a new garden; and, I am also supposing a garden to be made in what I deem nerfection. Those who cannot, from whatever circumstance, attain to this perfrom whatever circumstance, attain to this per-fection, may, nevertheless, profit from these instructions as far as circumstances will allow.

31. The fence of a garden is an important matter; for, we have to view it not only as giving protection against intruders, two-legged as well as four-legged, but as affording shelter in cold weather and shade in hot, in both which respects a fence may be made of great utility in an American Garden, where cold and heat are experienced in an extreme degree.

32. In England the kitchen-gardens of gen-tlemen are enclosed with walls from ten to sixto afford the means of raising the fruit of Peaches, Nectarines, Apricots, and Vines, which cannot, in England, be brought to perfection without walls to train them against; for, though the trees will all grow very well, and though a small sort of Apricots will sometimes ripen their fruit sort of Apricots will sometimes ripen their fruit away from a wall, these fruits cannot, to any extent, be obtained, in England, nor the Peaches and Nectarines, even in France, north of the middle of that country, without the aid of walls. Hence, in England, Peaches, Nectarines, Apricots, and Grapes are called Wall-Fruit. Cherries, Plums, and Pears, are also very frequently placed against walls; and they are always the finer for it; but, a wall is indispensably necessary to the four former.

42. This work should be done in the first or second week of October, even though the leaves should yet be on the plants. For their roots will strike in this fine month, and the plants will be get the plants, unless I, in the outset, bring them, or their seeds, from England! However, I moment the ground is fit in the spring; because, if you delay it too long, the heat and drought proceed to describe this fence that I would have, if I could. sary to the four former.

after they will no longer produce in the sun. Currant trees and Goosberry trees will not do well in this climate unless they be in the shade. Raspberries also are best in the shade; and, during the heat of summer, lettuce, radishes, and many other things thrive best in the shade.

side and also on the South side. The former gives me a fine, warm extensive border in the spring, and the latter a border equally extensive and as fence that I would recommend.

one need not be afraid of ultimate success; and now in use; or, that they must be, in a few and leave it nice and neat. years, suffered to lay waste.

38. Yet, with all these circumstances in my cond week of October, even

33. In America a fence is not wanted for this purpose; but it is very necessary for protection; for shelter; and for shade. As to the first, gardeners may scold as long as they please, and law-makers may enact as long as they please, mankind never will look upon taking fruit in an orchard or a garden as felony nor even as trespass. Besides, there are, in all countries, such things as boys; and every man remembers, if he be not very forgetful, that he himself was once a boy. So that, if you have a mind to have for your own use what you grow in your garden, the only effectual security is an insurmountable fence. This prevents the existence of temptation, in all cases 39. In England it is called a Quick-Set Hedge. security is an insurmountable fence. This prevents the existence of temptation, in all cases dangerous, and particularly in that of forbidden fruit; therefore the matter reduces itself to this very simple alternative: share the produce of your garden good-humouredly with the boys of the whole neighbourhood; or, keep it for your own use by a fence which they cannot get through, under, or over. Such a fence, however, it is no trifling matter to make. It must be pretty high; and must present some formidable obstacles besides its height.

34. With regard to the second point; the shelter; this is of great consequence; for, it is very well known that, on the south side of a local product of the second point; the shelter; this is of great consequence; for, it is very well known that, on the south side of a local product of the second point; the second point; the shelter; this is of great consequence; for, it is very well known that, on the south side of a local product of the second point; the second point; the shelter; this is of great consequence; for, it is very well known that, on the south side of a little berry, which, when it is ripe dangerous, and particularly in that of forbidden in the fall, is of a red colour. Within the red spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the best way. Let the spring; but, this is not the paper. Spring; but, this is not the best way. Let the spring; but, this is not the paper. Spring; but, this is

good high fence, you can have peas, lettuce, they are taken from that situation and planted radishes, and many other things, full ten days very thick in rows, in a nursery, where they earlier in the spring, than you can have them in the unsheltered ground. Indeed, this is a capityear. Then they are ready to be planted to betal consideration; for you have, by this means, come a hedge. In England there are two ways ten days more of spring than you could have of planting a hedge, as to position of ground. without it.

35. The shade, during the summer, is also other on the level ground. The latter is that, of valuable. Peas will thrive in the shade long which I have now to speak.

41. The ground for the Garden being prepared, in the manner before described under the head of Soil, you take up your quick-set plants, prune their roots to within four inches of the part that was at the top of the ground; or, in other words, leave the root but four inches long, taking care 36. It will be seen presently, when I come to to cut away all the fibres, for they always die; speak of the form of a garden, that I have fixed and they do harm if they be left. Make the on an Obtong Square, twice as long as it is ground very fine and nice all round the edges of wide. This gives me a long fence on the North the piece intended for the garden. Work it well with a spade and make it very fine, which will demand but very little labour. Then place a line along very truly: for, mind, you are planting cool as I can get it, in the heat of summer. Of for generations to come! Take the spade, put the various benefits of this shelter and this shade the edge of it against the line; drive it down I shall, of course, speak fully, when I come to eight or ten inches deep; pull the eye of the treat of the cultivation of the several plants. spade towards you, and thus you make, all along At present I shall confine myself to the sort of a little open cut to receive the roots of the plants, nce that I would recommend.

which you will then put into the cut, very up37. I am aware of the difficulty of over-right, and then put the earth against them with coming long habit, and of introducing any thing your hand, taking care not to plant them deeper that is new. Yet, amongst a sensible people, in the ground than they stood before you took such as those, for whose use this work is intended, them up from the nursery. The distance bethem up from the nursery. The distance be-tween each plant is twelve inches. When this tlemen are enclosed with walls from ten to six-teen feet high; but this, though it is useful, and indeed necessary, in the way of protection against two-legged intruders, is intended chiefly the side of it, and at six inches from it, in Ruta Baga. The people of this country listen against two-legged intruders, is intended chiefly the side of it, and at six inches from it, in exactly the same manner; but, mind, in this se-patiently; and, if they be not in haste to decide, cond line, the plants are not to stand opposite the they generally decide wisely at last. Besides, it plants in the first line, but opposite the middles is obvious to every one, that the lands, in the of the intervals. When both lines are planted, populous parts of the country, must be provided tread gently between them and also on the outwith a different sort of fence from that which is sides of them, and then hoe the ground a little,

42. This work should be done in the first or se-

43. In both cases the plants must be cut down almost close to the ground. If you plant in the

the new shoots, that is to say, not cutting down to good manner, and with a pair of Garden Shears. your last cut, but keeping the side always in a So that the expences to get a complete hedge pyramidical slope, so that the hedge may always round the garden would be as follows:

51.

ty year. thus the hedge will go on getting higher and higher, and wider and wider, till you have it at the height and thickness that you wish; and when it arrives at that point, there you may keep it. Ten feet high, and five feet through at bottom, is what I should choose; because then I have fence, shelter, and shade ; but, in the way of fence, five feet high will keep the boldest boy off from trees loaded with fine ripe peaches, or

as possible of equal size; else some get the start of others, subdue them, and keep them down, and this makes an uneven hedge, with weak parts in it. And, when the plants are first pulled up out of the seed-bed, they are too small to enable you clearly to ascertain this inequality of size. When the plants are taken out of the seed-bed and transplanted into a nursery, they are assorted by the nursery men, who are used to the business. The strong ones are transplanted into one place, they come to be used for a hedge, they are altered they come to be used for a hedge, they are altered they come to be used for a hedge, they are altered they come to be used for a hedge, they are altered too, what a difference would the alteration make turn short about, and drop back again, making the standard turn short about, and drop back again, making a noise expressive of their disappointment. Now, a noise expressive of their disappointment. Now, Fowls will alight on wooden, brick, or stone they are altered to the standard turn short about, and drop back again, making a noise expressive of their disappointment. Now, and in the look, and in the real value too, of those a noise expressive of their disappointment. Now, Fowls will alight on wooden, brick, or stone and the weak ones into another so that, when

long, perhaps, by October. Then, before win- ping during the same time, would require about the summer. Allow three times as much in ter, you must clip it again, leaving some part of thirty dollars, if it were done in an extraordinary America, and then the annual expense of the

48. And thus are a fence, shelter and shade, 48. And thus are a fence, shelter and shade, and forty eight dollars. A Locust fence, I also everlasting duration, for a garden, containing low, will last for ever; but, then, what will an acre of land, to be obtained for this triffing a fence all of Locust, cost? Besides the difference of the heavest of even a hadre it is important. off from trees loaded with fine ripe peacets, of land, to be obtained for this trining a fence all of Locust, cost? Besides the difference in the look of the thing; besides the vast, othat, nothing further need be said upon the possible for any one, who has not seen it, to form subject! The height is not great; but, unless the an idea: contrasted with a wooden, or even a and the shade; and besides, that, after all, you assailant have wings, he must be content with brick fence it is like the land of Canaan compar-feasting his eyes; for, if he attempt to climb the hedge, his hands and arms and legs are full of ful in hue as well as in shape. It is one of the 52. However, the assailant have wings, he must be content with hedserts of Arabia. The leaf is beautic hedge, his hands and arms and legs are full of thorns in a moment; in the according to the deserts of Arabia. The leaf is beautic hedge, his hands and arms and legs are full of thorns in a moment; and he retreats as the fox did from the grapes, only with pain of body in addition to that of a disappointed longing. I really feel some remorse in thus plotting against the poor fellows; but, the worst of it is, they will have the early part of spring, and the shade it gives be content with fair play; they will have the early part of spring, and the shade it gives asson hasts; and, therefore, I must, however reluctantly, shut them out altogether.

46. A hedge five clear feet high may be got in six years from the day of planting. And, now let us see what it has cost to get this fence round my proposed garden, which, as will be seen under the next head, is to be 300 feet long and 150 feet wide, and which is, of course to have 90 feet length of hedge. The plants are to be a foot apart in the line, and there are to be two lines consequently, there will be required 1800 plants or suppose it to be two thousand. I think it will be strange indeed, if those plants cannot be raised and sold, at two years old, for two doldars a thaveneves been transplanted, but just pulled up out of the spot where they were sown, your hedge will be a plant seed of the spot where they were sown, your hedge will be a dead of the spot where they were sown, your hedge will be a dead of the spot where they were sown, your hedge will be a dead of the spot where they were sown, your hedge will be a dead of the spot where they were sown, your hedge will be a dead of the spot where they were sown, your hedge will be a dead of the spot where they were sown, your hedge will be a dead of the spot where they were sown, your hedge will be a dead of the spot where they were sown, your hedge will be a dead of the spot where they were sown, your hedge will be a dead of the spo

in the look, and in the real value too, of those gardens, meadows and fields!

50. It may be said, perhaps, that, after you have got your hedge to the desired height, in the first place, you can have nothing good from the earth without annual care. In the next place, a wooden fence will soon want nailing and patching annually, during the years of its carden from weeds would require about two days work in a year for five or six years:

whe look, and in the real value too, of those gardens, meadows and fields!

50. It may be said, perhaps, that, after you have got your hedge to the desired height, in must still be kept clipped twice in the summer; and that, therefore, if the fence is everlasting, the trouble of it is also everlasting. But, in the first place, you can have nothing good from the earth without annual care. In the next place, a wooden fence will soon want nailing sees, the ground ought to be well prepared, and patching annually, during the years of its cattle, sheep and pigs kept effectually off, until two days work in a year for five or six years:

such work is done for a henny a rod, twice in woold soon stock the whole country; and they work is done for a henny a rod, twice in woold soon stock the whole country; and they

garden hedge will be less than four dollars a

51. Thus then, at the end of the first twen-ty years, the hedge would have cost a hundred and nine dollars. And, for ever after, it would cost only eighty dollars in twenty years. Now, can a neat, boarded fence, if only eight feet high, and to last twenty years, be put up for less than six dollars a rod? I am convinced that it cannot; and, then, here is an expense for every twenty years, of three hundred and the shade; and besides, that, after all, you have, in the wooden fence, no effectual protec-

beauty of the English fields and gardens, and not a small one from English rural poetry.

49. And why should America not possess this most beautiful and useful plant? She has English gew-gaws, English Play-Actors, English Cards and English Dice and Billiards; English fooleries and English vices enough in all conscience; and, why not English Hedges, instead of post-and-rail and board fences? If, instead of these steril-looking and cheerless enclosures the gardens and meadows and fields, in the hedge has arrived at the age of six years, as before mentioned.

53. There yet remains one advantage, and that not a small one, that a quickset hedge possesses over every other sort of fence; and that is, that it effectually keeps out houltry, the depredations of which, in a nice garden, are so intolerable, that it frequently becomes a question, whether the garden shall be abandoned, or the poultry destroyed. Fowls seldom, or never, the neighbourhood of New-York and other ci-dence, first alight upon it, and then drop down the neighbourhood of New-York and other ci-dence, first alight upon it, and then drop down

may be brought from England, either, in plant or in berry. But, there are many here already. If more are wanted, they can be had any month of December, being shipped from England, in barrels, half sand and half berries, in November. The berries, which are called hams, are ripe in November. They are beaten down from the tree, and cleared from leaves and bits of wood. Then they are mixed with sand, or earth, four bushels of sand, or of earth, to a bushel of haws. They are thus put into a cellar, or other haws. They are thus put into a cenar, or other cool place: and here they remain, always about as moist as common earth, until sixteen months after they are put in; that is to say, through a winter, a summer, and another winter; and then they are sown (in America) as soon as the frost is clean out of the ground. They ought to be sown in little drills; the drills a foot a part, and the hows about as thick as nees in the drills. and the haws about as thick as peas in the drills. Here they come up; and, when they have stood till the next year, you proceed with them in the

manner pointed out in paragraph, 40.

56. These haws may be had from Liverpool,

Seldom in the latter; for, the birds eat them at direction. But, when beds are sown with smaller a very early period. They are ripe early in Notwember; and, half haws half sand, may be had, I dare say, for two dollars a barrel at any place. Three barrels would fence a farm! And, as America owes to Europe her Wheat, why be ashamed to add fences to the debt? But (and with this I conduct,) if there be a resolution structions. A chain, or a line, and pole, are all lands to common rather than the can want for the purpose, and hole, he has formed to throw all lands to common, rather than he can want for the purpose, and those he has take the triffing trouble to make live fences, I do hope that my good neighbours will not ascribe these remarks to any disposition in me to call in question the wisdom of that resolution.

The way is to take out the must be dug out. The way is to take out the must be dug out. call in question the wisdom of that resolution.

Plate 1. J E. 50 30 40 60

This is not, strictly speaking, a plan; because it exhibits trees in elevation; but it will answer the purpose. Of the sorts of which these trees are, and of other circumstances belonging to them, I shall speak fully under the head of Fruits. The precise description of the Hot-Beds will be found under that head. At present my object is to explain the mode of Laying-out the Ground.

59. The length of the Garden is 100 yards, the breadth 50 yards, and the area contains a sta-tute acre; that is, 160 Rods of 16½ feet to the Rod. In order to bring my length and breadth within round numbers, I have been obliged to add 6 rod and 58 square feet; but, with this trifling addition here is a spot containing an acre of land. Before, however, I proceed further, let me give my reasons for choosing an Oblong Square, instead of a Square of equal sides. It will be seen, that the length of my garden is from East to West. By leaving a greater length in this direction than from North to South, three important advantages are secured. First, we get a long and warm border under the North fence for the rear-

portion of the whole is sheltered, during winter and spring, from the bleak winds.

fractions unnoticed. In the English gardeninging of things early in the spring. Second, we get a long and cool border under the South fence for shading, during the great heats, things, to which a burning sun is injurious. Fourth, by this shape of the area of the Garden a larger other larger things in rows should have the same least, the prices of sugar; and yet sugar, under

Figure 1, in Plate IV. exhibits a piece of the carth about four inches deep, and spread it over Garden-Hedge in elevation, in the winter season. See this Plate IV. in Chapter V.

LAYING-OUT.

LAYING-OUT.

earth about four inches deep, and spread it over the adjoining ground, some on each side of the walk or path, taking care to fling, or carry, the earth, so dug out, to such a distance, that every earth, so dug out, to such a distance, that every part of the ground, which is not walk or path, 57. The Laying-out of a Garden consists in the division of it into several parts, and in the allot-receive an equal proportion of what is thus dug ting of those several parts to the several purpo-out. Gravel may be put in the walks and paths: ses for which a garden is made. These parts it makes the whole look neater; but, in a country consist of Walks, Paths, Plats, Borders, and a where the frost is so hard in winter and the Hot Bed Ground. 56. These haws may be had from Liverpool, from London, or from almost any Port in Great Britain or Ireland. But, they can be had only in the months of November and December.

Hot-Bed Ground.

58. To render my directions more clear as well said to be necessary, while it may be trouble-as more brief, I have given a plan of my pro-it will get into the borders; and, there it must do harm.

> 62. It will be seen, that about a third part of the Garden is appropriated to Fruit trees. The reason for this, and the uses of the other parts of the ground, will be fully stated in the Chapters on Cultivation. I have here treated merely of the form and the dimensions, and of the division, of the Garden. It is in treating of the cultivation of the several sorts of plants that our attention will be brought back to a close contemplation of the several parts included in this division.

CULTIVATION OF COTTON.

The following extract from a circular, from the house of Cropper, Benson and Co. under the date of the 27th September, contains some views and estimates in relation to the culture and sale of cotton, which may be very interesting to the planter and merchant.—Savannah paper.

Annexed, we give two estimates, drawn up by two different planters, neither knowing any thing of each other's statement, nor we of their's, and though there is some trifling difference in the mode of estimate, yet it will be seen that they exhibit almost exactly the same result.

This is the present mode of management, with which the planters must be content, if they can do no better. But sugar on the banks of the and spring, from the bleak winds.

60. Having such a spot before us, little difficulty can arise in Laying it out. Indeed, it is only necessary to state the dimensions. The several parts are distinguished by numbers. The long walk, running from East to West is 6 feet wide, as is also the cross walk, in the middle. All the paths are 3 feet wide. The borders, Nos. 2 and 3, are 9 feet wide. The dimensions of the Plats Nos. 5, 7, 8, 9, 10, and 11, are (each) 70 feet from East to West and 56 from North to South. Plat. No. 6, is 56 feet by 50, only 7 cents, whilst sugar, by the last advices North to South. Plat. No. 6, is 56 feet by 50. only 7 cents, whilst sugar, by the last advices Plat, No. 4, is 60 teet by 36. The Hot-bed from New Orleans, is quoted 9 to 11 cents, or 8 Ground, No. 1, is 70 feet by 36. I leave trifling cents on the plantation. Estimating the profit fractions unnoticed. In the English gardening of the one culture with the other, upon this scale books, they call those parts of the garden of prices, whilst the one only pays 21 per cent. "Quarters," which I call Plats; but, for what the other would pay about 23 per cent, per anreason they so call them it would be difficult to num. Estimates are not always to be depended conjecture. I call them *filats*, which is the proper word, and a word, too, universally understood. mate in this case. We know that in Barbadoes the A plat is a piece of ground; and it implies, that culture of cotton is nearly given up, and in Dethe piece is small, compared with other larger merara, though sugar has very much increased, portions, such as fields, lots, and the like. I will yet there has been a decrease in cotton. Now,

not the change be very rapid where sugar is even

higher than cotton?

Next as to manufacturing: the planters are giving in some cases, 40 cents per yard for cotton bagging. This they might make themselves from cotton, as is done in the Brazils, with great advantage. They might also make their own clothing, especially that of the negroes. If they changed their system in this respect, and grew and made every thing they wanted, they might certainly sell their surplus cotton at any price; but it must be borne in mind, that they would have much less to sell. They have the spinning jenny, in some parts of North Carolina, amongst the farmers; weaving is carried on in almost every part of the world; and a little consideration will show what great advantages they would have in manufacturing.

The bale of cotton which the planter can only manufacturer for less than 91. and when to this the expense of manufacturing is added, the whole ing cotton and importing manufactured goods, the planter pays 100 per cent. on the wages paid in England, and he would gain an advantage to this extent if he manufactured them at home. Perhaps it will be said that wages are higher; let us examine this. The average produce of a slave's labour is 11 bags of cotton, or 61. 15s. being about 5d per working day. Now we think

we do not over rate the earnings of a whole family in our cotton manufacturing districts, if we take them at 5s. per week, reckoning the whole population, whether able to work or not. Five shillings per week is 10d. per day; yet the planter now gives 100 per cent, which makes 20d.

That low prices will make the planters turn to something else, is not mere conjecture; we can refer to the years of the embargo and the war .-Before the commencement of that period, viz. in 1807, the export of cotton, from America to this country, was 171,000 bags; there was no year from that to 1816, when the imports were the whole of one crop, and then our imports were 166,000, and in 1817, 197,000. The crop of 1807 was a great one, and, therefore, it would not be fair to take that singly; putting the crop of 1806 to it, which was 124,000, it will make an average of 148,000 bags; whilst 1816 and 1817, put together will make 182,000 bags, an increase of only 20 per cent. whilst the population had increased about 30 per cent. This, too, comprises three years, when the inducement to plant extensively would be great; so that there is a strong probability that, for a part of the time of the embargo and war, the cultivation of cotton must rather have receded than gone forward; and yet at that time they knew little of the growth of sugar. They could, during these periods, sell cotton, if they chose, and they would naturally look forward to a better market for their produce at the termination of their disputes with this

A part of the extension of the cultivation of cotton, arises from the purchase of slaves, which they would have the power, as well as the inducement, to do, while cotton sold above 15 cents; but when it has fallen to half that price, they will have neither. This will at once take off 7 of the 10 per cent, increase, for their natural increase is only about 3 per cent. We may also Food, 13 bushels of corn, or 1 peck per suppose a transfer to sugar of, perhaps, one-eighth, or 121 per cent.; for the Americans move about rapidly to what pays them best; and, surely, for both time and cotton consumed in manufacturing cotton bagging, and their own clothes,

these circumstances, has been preferred. Will we may put 10 per cent. more: these together One suit of osnaburgs not the change be very rapid where sugar is even will make 29½ per cent. We will call it 30 per Tools, vehicles, and horses cent. which would reduce the crop, to arrive in Tax 1824, from 645,000 bags to 452,000 bags, reducing the stock at the end of that year 193,000; but that would be impossible, for it was only estimated in the other case at 149,000 bags.

It is quite evident then, if it were possible that our present prices should continue, we should have such a decrease in the growth, and such an increase in the consumption, as would, at a very early period, leave us without a bag of cotton on

The apathy which has allowed the prices of cotton to fall to their present rates, pervades other branches of commerce; for though it is reasonably estimated, that, at the present rate of consumption, all the sugar in the country will be exhausted before the new will arrive, yet the holders are selling at the lowest price sell for 41. 10s. cannot be delivered to the British ever known, and look on these facts, with which they are perfectly acquainted, as though it could never rise again. Last year's crop of cannot be conveyed back to the planter without corn is generally estimated not to have supplied an addition of fully fifty per cent. in duty and the country more than 11 months; and though profit. Then we may fairly say, that, in export- the present crop was less than the preceding, and the consumption going on at a greater rate than ever known, still the price is lower than ever remembered. If the present un-mercantile Bagging, at 90 cents per bale feeling of holding no stocks is to continue to prevail, we may be quite run out of all these important articles before any one is aware. CROPPER, BENSON & CO.

ESTIMATES.

South Carolina contains 502,741 inhabitants, of which 258,475 are slaves. Georgia contains cent. 340,989 inhabitants, of which 148,482 are slaves. Alabama contains 127,901 inhabitants, of which 41,000 are slaves. Mississippi contains 75,448 inhabitants, of which 32,814 are slaves. Louisiana contains 153,407 inhabitants, of which 68,500 are slaves. Tennessee contains 422,613 inhabitants, of which 80,000 are slaves. Total, 1,623,099 inhabitants, of which 629,271 are slaves.

Total population as above 1,623,099 Deduct slaves 629,271 Leaving a population of free persons of 993,828 Deduct for free coloured persons 20,828 Leaving a population of white persons of 973,000 It is commonly estimated that one slave to every ten white persons, is employed for domestic purposes, which will give 97,300 Estimated number of slaves on sugar and tobacco plantations 40,000 Do. on rice 40,000 Do. mechanics 20,000

Total 197,300 Total slave population Effective and non-effective hands employed otherwise than on cotton plantations as above 197,300 Leaving effective & non-effective slaves on the cotton plantations

431,971

First estimate of cost on cotton plansations. week, at 70 cents per bushel hat, \$1 50; 2 pair shoes, \$2 50; 1 blanket, \$3 6 yards plains, at 75 cts. 4 50; doctor and physic, \$1

1 50 \$25 60 100 negroes are equal to 60 good working hands: 100 average negroes worth now perhaps \$350 each \$35,000 100 average negroes or 60 working hands will cultivate each 31 acres, or 210 acres, worth per acre 50 dollars 10,500 Planter's capital \$45,500 If one working hand cultivates 31 acres, which give 900lbs of clean cotton, 60 working hands, or 100 average hands, will cultivate 210 acres, which yield 54,000 lbs. clean cotton, which, at 11 cts. per lb. is gross \$5,940 Deduct the expense of keeping 100 hands at \$24, in lieu of 25 60, the Factorage, 21 per cent. on \$5,940 148 Carriage, rent, drayage, and labor on 185 bags or 54,000lb weight, at \$2 50 712 256

INTERNAL IMPOVEMENT.

A Sketch of the Great Northern or Champlain Canal.

WATERFORD, 28TH Nov. 1822. On this day the last stone of the Northern or Champlain Canal, was laid by Governor Clinton, President of the Board of Canal Commissioners, in the presence of a great assemblage of people. The ceremony was solemn and impressive. Before the laying of the stone, the President delivered a short address, which stated in substance, that he proceeded with great pleasure, in the presence of his assembled fellow-citizens, to consummate a great work devoted to the interests of Agriculture, Manufactures, and Commerce, and connecting the gulf of St. Lawrence with the Bay of New-York. He invoked the smiles of the Almighty Father of the Universe on the work and ing. The stone was then laid amidst the acclamations of the people, and a most eloquent praymarble and excellent workmanship, into the Canal. The marble was procured from Westchester county, and is firmly cemented by hydraulic mortar, made of Northern lime-stone. The locks are spacious circular basins for the accommodation junction with the western. This latter portion is of boats passing out and into the river. Water- nearly completed. ford is the head of sloop and boat navigation of shed to it; indeed it has already been navigated by boats of transportation. One has just arrived from Lake Ontario, by the St. Lawrence and So-rel rivers, and Lake Champlain; and I saw with great pleasure, packages and boxes, stowed on the banks of the Canal, destined for Whitehall

to wit, at Fort Ann, there are three locks, which gates, and yet it never occurred to that ingenious descend to the level of Wood Creek and Halfway people. The first lock was constructed by the Brook. These streams unite below the village, Brook. These streams unite below the village, and feed this lower level of the Canal. Some short distance below this junction, there is a lock recently located and made of wood. The upper level of the canal from Fort Edward to Fort Ann is supplied by the Hudson: the water commodities from an extensive range of country

There is a striking feature in the geology of this route, which deserves a scrutinizing examina-tion. It appears that the Hudson River at Fort Edward, which, you know, is below Glen's and Baker's Falls, is 22 feet higher than Lake Champlain. There is a descent of 50 feet from the summit level at Fort Ann, to the Lake at Whitehall, and 28 feet to the river at Fort Edward. Forty or fifty feet high, in the primitive rocks at a place called the Narrows in Wood Creek, there are great cavities or pots, produced by the action of rotary stones under the power of water falling perpendicularly: a critical inspection of these lapideous excavations might determine whether the Hudson River did not, previous to its rupture of the great barrier at the Highlands, diverge to the north in this di-rection. From the Canal at Fort Edward to Fort Miller Falls, 8 miles, the river is used in lieu of the Canal, and is kept up to the requisite altitude by a dam. Round those falls there is a short Canal of half a mile, which unites again with the river by two locks; the river is again used for about two and a half miles, and then by a dam it is forced into a canal, on the west side, the occasion, and supplicated the realization of a dam it is forced into a canal, on the west side all the blessings anticipated from this undertak-which extends about 26½ miles to Waterford.— This part contains six locks, and at Waterford there are three more, making in the whole exr was offered to the throne of grace by the Rev. Dr. Blatchford. The company passed in two boats, drawn by five elegant horses, from the river through a tier of three locks of white marble and excellent workmanship, into the Canal. waters with the western or Erie Canal, after crossing the Mohawk River by a dam, and which river is thereby put into requisition as a feeder of eleven feet lift each, and are almost perfectly for the northern Canal, in both a northern and water-tight. Between the locks there are two southern direction, and also before and after its

This whole extent is 64 miles. The work was the Hudson, and the Northern Canal is now fin- commenced on the 10th of June, 1818, and has their way to our great commercial emporium. been finished in somewhat more than four years. When compared with similar works in the old world, the execution may be pronounced a rapid one, and has never been exceeded in that respect, except by its relative, the western Canal. The celebrated Canal of Languedoc is 148 miles

\$80 is really the cost of an acre of the land ac- |Champlain, to Waterford, where it finally enters kin to Canton, by canals and rivers, is 920 miles, the Hudson River, the distance is about 611 and the voyage takes a boat three months. On miles. From Whitehall to Fort Edward, there our canals the same extent could be passed in are 19 miles of Canal, and about 5 miles of the one month. The truth is, that the Chinese cawaters of Wood Creek. In this space there are nals are very inferior to the European. Instead ten locks: three at Whitehall to let boats of locks, the boats are drawn up and let down down into the Lake: three at Fort Edward for inclined planes by human power, at vast expense the same purpose, as to the Hudson River; about and trouble. A lock appears to be a very simple half way between Fort Edward and Whitehall, invention. It is but a sluice with two double

> The influence of these works is already felt, not only in different parts of the United States, but has extended to Europe. The transportation of merchandise from Philadelphia to Pitts-Fort Ann is supplied by the Hudson: the water is impelled into a feeder by a most stupendous dam of 30 feet altitude, erected across that river, and there is now another feeder preparing to run from above Glen's Falls, and to pass into the Canal north of Sandy Hill, which will also serve as an auxiliary Canal, to convey lumber and other commodities from an extensive range of country year been immense, because the western settlers have found a market; and the share holders of our vader-land will be astonished at the unex-

pected increase of their profits.

In their report of 1817, the Canal Board estimated, that the country within the reach of the northern Canal, would furnish annually two millions of boards and planks; one million feet of square timber, and immense quantities of dock logs, scantling, masts, and spars. Besides, those northern regions are the sites appropriated by nature for her mineral productions; and it is well known that they contain iron ore unsurpassed for quantity and quality; marbles of various kinds and colours; lime stone from the primitive to the secondary, and the materials of the best hydraulic cement; bark for tanning and other manufacturing processes; inexhaustible stores of pot and pearl ashes; wheat, flour, butter, cheese, flax, flax-seed, wool, beef, pork, and maple-sugar; the best of cattle for the butcher, dairyman and grazier, and the finest sheep, hogs, and poultry, besides the fruits of autumn. In going to the New-York market, the proprietors of these articles follow the current of interest, and the direction of political affinity, and their preference is enforced by the act of the British Parliament, fettering our commerce with the Canadas, and thereby imposing the necessity of a limited or partial trade with those countries.

We cannot form any definite opinion of the va-lue or the amount of commodities, that will be conveyed down the Canal, nor of the merchandise that will be returned, because it has not been in operation until this day. So far back as July last, it was estimated such was the immense amount of lumber in the Canal and in the Lake, waiting for the advent of the waters, that it would take twenty days for that in the Lake to pass into the Canal, and forty days for that in the lower level to pass into the upper; and the waters of the Hudson are, even at this advanced period of the season, covered with rafts, making

-00 LETTER V. ON THE POOR LAWS.

SIR-The Poor Laws are not less subservient and Peru, in Clinton county.

As the importance of this Canal is not sufficiently appreciated, nor its character extensively known, it may not be amiss to subjoin a lew remarks, which I have derived principally from the enlightened acting commissioner.

From Whitehall, where it unites with Lake

not commit perjury. If the greatest criminality child is about to become chargeable to the coun-of seduction consist in the ruin of its victim, se-ty, in consequence of the poverty of its parents, libertinism in a man, as to incontinence in a duction is no longer a vice, except among the its care shall be committed to the Overseers of woman? Does a man forfeit all the respect and higher classes of society. Our legislatures have, the Poor, and upon their requisition, a tax shall good will of his neighbours and friends, is he hitherto, refrained from declaring prostitution be levied upon the county, for its support; and declared an outcast from society, and hunted among the lower classes of females, praisewor-thy, but they have not hesitated to attach to it the reward of merit, by making it profitable.-Lest any mistrust of her enamoured hero's vows, lest any sordid fear of loss of bread, from the in a neighbouring county, and which, I dare say, male acquaintance, while she leads the life of a loss of character, should check the full tide of may be paralleled in every county in the state, the fair one's tenderness, or throw a chill on her In this case, the lover and his beloved were both dissolving heart, which pants to give a loose to poor. The maiden had obtained a comfortable all the joys of love; a grave, wise Senator appears, his countenance beaming with all the be fear of starvation before her eyes, and being innignity of venerable worth, and signs a deed of stigated by the too-persuasive eloquence of some settlement, with the wealth of the whole state, as security, for the maintenance of herself and all the tender pledges of her generous passion. Is this an unfair representation of one branch of the Poor Laws? Do they not pay a bounty, and a high one too, on the production of bastards? And while our farmers are so feelingly and so And while our farmers are so feelingly and so justly complaining of the taxes they pay to supracter, will any doubt of the security of his promises, any fear of being left destitute in a world, to whose respect she has forfeited all claim, pre-ther she had contracted an affection for the when she knows, that rather than have his character exposed in a court of justice, he will submit to almost any imposition? But suppose that the libertine is not rich, and has little regard on this score, for his character, and that the woman knows this, and has no faith in his promises—still she has faith in the promises of the law; she knows that the law will force him to pay a sufficient sum for the support of his child; and that the Overseers of the Poor must give the money to some one to take care of the child. Who can they find to do this better, or at a less price than the mother? To her, therefore, it is given. If she has other means of support, this money is a positive and considerable income, since a mother, living at home, can maintain her child for a much smaller sum than would inchild for a much smaller sum than would induce any other person to undertake the charge. In these two cases, the law's encouragement to vice is indirect, and its provisions may, upon the whole body of the people, and is collected with as much speed and certainty as the taxes which support the government. It will not only the people are the provisions may, upon the whole body of the people, and is collected with as much speed and certainty as the taxes which support the government. It will not only the people are the people and is collicted with as much speed and certainty as the taxes which support the government. It will not only the people are the people and is collicted with as much speed and certainty as the rect corruption of female virtue may be in a people are the people and is collicted with as much speed and certainty as the litical view, it is much more reprehensible in a people are the people are the people are the people and is collicted with as much speed and certainty as the litical view, it is much more reprehensible in a people are the peo a superficial examination, be defended with some show of plausibility; since it may be proper to make the seducer maintain his own offspring, and pay a penalty for his indulgence in criminal pleasures. I shall, however, shew, presently, reasons (in addition to those already stated) for believing that even in these cases, the law does more harm than good. But where the law does more harm than good. But where the law does more harm than good. But where the law does more harm than good. But where the law does more harm than good. But where the law does more harm than good. But where the law does more harm than good and the law's inducement duction by deterring men from making the attention of laws tending to call upon all those, whose mistaker notions of charity and humanity have ranked them among the foremost opponents of a proposition to abolish the Poor Laws, to relinquish their opposition. If the arguments used in this classification is a deed of trust, upon his motions of charity and humanity have ranked them among the foremost opponents of a proposition to abolish the Poor Laws, to relinquish their opposition. If the arguments used in this classification is a deed of trust, upon his motions of charity and humanity have ranked them among the foremost opponents of a proposition. If the arguments used in this classification is a deed of trust, upon his motions of charity and humanity have ranked them among the foremost opponents of a proposition. If the arguments used in this connexion with size position to abolish the Poor Laws, to relinquish them among the foremost opponents of a proposition. If the arguments used in this connexion with size position to abolish the Poor Laws, to relinquish them among the foremost opponents of a proposition. If the arguments used in this connexion with size position to abolish the Poor Laws, to relinquish them among the foremost opponents of a proposition. If the arguments are proposition to abolish the position to abolish the Poor Laws, to relinquish them among the foremost o sently, reasons (in addition to those already stated) for believing that even in these cases, the law does more harm than good. But where both the parties are poor, the law's inducement to the violation of moral principle is direct and to the violation of moral principle is direct and the constitution by deterring men from making the all other laws for the prevention of comme have that his vector has believed that his vector has a sent in this subject have been described in this letter and in my last, are just, and the constitution to which they have led, are true; can duction by deterring men from making the all other laws for the prevention of comme has a sent in this subject. The laws upon this subject have been described in this constitution. In the arguments used in this letter and in my last, are just, and the constitution to which they have led, are true; can duction by determine the provided in this letter and in my last, are just, and the constitution to which they have led, are true; can any good man, reconcile to his conscience the duction by determine the provided in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my last, are just, and the constitution in the arguments used in this letter and in my l immediate in its operation: and is so far from all other laws for the prevention of crime, by ex- believes that his vote has sanctioned the increase possessing even the shadow of justice, that it makes the most moral and religious citizens in the country, actually pay, out of their own pockets, the wages of prostitution; and compels the virtuous to become the purse-bearers of all those whose vicious inclinations might be restrained, by the want of means to purchase the gratification of their licention desires. One of the provisions of a bastard child, likely to operate as powerfully on a man as on a woman? Do the present

for the support of the mother, also, as long from the company of his equals, because he is as her confinement may render her unable to not a very Joseph in his life? Or can a woman work. The operation of this law, I will illus- still retain the esteem and affection of her assotrate by an instance which has actually occurred situation, in a decent family, but not having the Lothario, among the ploughboys-

sophical inquiry into the origin and nature of adSmut. We have stated before, that the practic covers the top only a few inches. The stirring cal question lies in a very small compass, and the results, in this view, are highly satisfactory and run off the brine, take out the wheat and lime lustful to cultivators: we have stated also, that it on the floor (not always, with fresh lime); there are certainly some anamolies, and we have the whole reasons as must necessarily be additionable reasons for eight bushels of physiology and pathology, animal and vegetiven, at sundry times, some probable reasons for them; such reasons as must necessarily be additionable to a floor, and put salt to it, some wet on who must otherwise deny all the facts which have been so many times proved by express exhemicant and the prevention of smut. We have learned by recent communication with Mr. Ely, an American gentlemen, who has just been making the floor, and sometimes after wheat has been brined. We are wholly faithless as to any good they do a state it but imperfectly, by recollection, useful. Now all the above have been followed from Mr. Ely's notes, but the main facts are sufficient for our purpose. Mr. Falla, along with his experiments in Spade Husbandry, this year when the supplied of the preference is to be given to the best Hereford Cathers and the preference of ignorance we herein labour under, we reced that and lime labour under, we such a state it out of these islands. In the North, he visited Mr. Falla, who has this season tried a very useful experiment on the prevention of Smut. We are wholly faithless as to any good they do the such as the such part of the prevention of Smut. We are wholly faithless as to any good they do the prevention of Smut. We seed sincess, which may be more injurious than seed in the prevention of Smut. We then they have succeeded it was own good they do the prevention of Smut. We seed some prevention of the prickle, nor when they have succeeded it was a proof of a deleterious seasor brined in qui

not his own moved one of progress of himself and d the way to ad vice which

the experiment.

The whole of this experiment, and every other shew bold and level, and does not need skimming.

We do not mean to deny but that some seataking notice also in this case, that the wheat severity.

orroboration of the utility of steeping; and, by ral mind can assert that nature is so capricious, quite unfit for any labour.

The Herefords are more equal as a class than lowers of the operation, if well performed, and the farmer without security for the cleanliness of the improved Short-horns. Their offal is equal-

Extracts from the late numbers of the London Farmers' Journal—received at the Office of the American Farmer.

ON SMUT.—By THE EDITOR.

We hope our readers will excuse the impertiency (if it have that appearance) of our entering personally into this question; and moreover, that they will not impute to us any thought or intention of a dictorial nature. We come to the subject as Mr. Jemmett has done, considering ourselves in a state of tutorage, as we must always remain as to the natural history, or philosophical inquiry into the origin and nature of Smut. We have stated before, that the practical question lies in a very small compass, and the

had a few smutty heads; the other two we do but leaving the wheat in the brine twelve hours. haps be doubted; but if I give it with imparant correctly remember; but the row sowed dry The rest may be all dispensed with, excepting that haps be doubted; but if I give it with imparant the cheapness of the steep may be an object; and not to be commented upon with too great the experiment.

The animals designated by the title Improved which has been purposely and properly made, is We do not mean to deny but that some sea- Short-horns are few in number, and they are favourable to brining, pickling, washing, stir-sons are attended with smut more than others; widely diffused, as they have obtained high pri-ring, skimming, and cleansing of every sort. One but it does not therefore follow, that Nature ces, and have been carried into various places to mode may be something better than another, but mocks our toils, and confounds our reasoning and ornament many stocks. They have soft, silky, they are generally useful. We cannot yet believe our experiments. There is no reason for such and mossy hair, and are very rich and mellow that either arsenic, sulphate or copper, urine, an assertion, unless we could shew that the seed-handlers; handsome and gay in colour; elegant or any thing else, will, by the touch, prevent the sisease; clean crops may be followed in these if not so, it was adequately brined and steeped, bone; level and complete in all their points, and cases where the seed was sound, but let those or otherwise steeped in such a manner as has take on fat rapidly. They give a moderate who mean to try useful experiments on preventing smut, take wheat which they know to be mutted, or the conclusion is nothing. mutted, or the conclusion is nothing. knows the first, or can suppose or believe the life, and on this account, as well as from the extreme laziness of their dispositions, they are

lowaess of the operation, if well performed, and the farmer without security for the cleanliness of the operation, if well performed, and the farmer without security for the cleanliness of the improved Short-horns. Their offal is equal-law the wheat in the tub several hours, even then steeping is not intended. Thus among severly brining, and skimming, will succeed better than any mode of picking the wheat on a lead further into the speculation started by or, or of dipping it in pickle by means of a sket. If of smutty wheat moderately dressed, but make two parcels, take one parcel and dress by reeing, and separate all light kernels, nut-balls, &c., then take the other and swim it agood brine, and skim it, and steep it in the improved Short-horns. Their offal is equal-ly fine, many of them handle well, and have a very good quality of meat. They give very little will, but breed well, and are hardy and healthy. We have expressed this the more strongly, because we hope that that dispute about smut is drawing to a close. We confine ourselves to the practical question, and do not wish to enlarge tree the practical question, and do not wish to enlarge the practical question, and do not wish to enlarge especially at an early age. They do not attain so great a stature in the same number of months, and have never at any period, but particularly in youth, that perfect symmetry which distinguishest two parcels, take one parcel and dress by reeing, and separate all light kernels, mut-balls, &c., then take the other and swim it agood brine, and skim it, and steep it in the lief that it is an equal time, that are established, they must be wholly vision-hall the farmer without security for the cleanlines of the mande.

Their offal is equal-ly fine, many of them handle well, and have a very good quality of meat. They give very little milk, but breed well, and have a very good quality of meat. They give yell the improved Short-horns. Their offal is equality. The improved Short-horns. Their offal is equality. The truth is, that ph

amination, to be the distinctions between the two

same food, and in the same relative circumstan ces, the Short-horns would be as good at two years old, as the Herefords are at three-ei, however, half a dozen of each were committed to the care of the same person, and brough : un precisely in the same manner, the result would be highly interesting; and if they were brought up here, I would give the Herefords their food

for nothing, if they were the conquerors.

I am well aware that without such a trial, there will continue to be a great difference of opinion communication: on this question; out as my object is truth and usefulness, and not fallacy and controversy, I submit my remarks with every deference, to the judgment of your readers, not being at all anxious hempen bag and express the oil by means of a sons; price of which, bound, \$5 per vol. or \$4 to enter into any defence of the opinion I have cold press, in the same manner as linseed oil. formed, if it can be proved to be erroneous, as I had no other wish to gratify, or purpose to serve, in making this laborious and extended sur- it very simple. vey of the two breeds, and in now informing you the result, than a desire to promote the interest of agriculture.

Why there should be so great a preference WELLS & LILLEY, Boston.

West of the cold pressed oil, I do not know.—PETER COTTOM, Richmond, Va.

Many families in my neighbourhood, prepare it, E. THAYER, Charleston, S. C.

In the mean time, till the experiment is fairly tried, I must remind your readers that the comparison is not between the excellent breed of Herefordshire and the wretched cattle with shorthorns, which find their way, very undeservedly, into many parts of the south, but between the best Herefords and that select and valuable breed age. to which the name of Improved Short-horns ought to be exclusively applied.

I am, your's, very respectfully, JAMES ARMITAGE RHODES.

Washington, Dec. 14. A CHALLENGE.

A VIRGINIAN proposes a wager of five hundred dollars, that he will exhibit at the Mary land Cattle Show, which may be held near Baltimore in the year 1824, a native Bullock of Virginia, of greater nett weight than any that can be exhibited at the same time and place, by any New YORKER, whose Bullock shall be a native of that State. The address of the Vir-ginian is left with J. S. Skinner, Esq. Editor of the American Farmer, Baltimore, through whom the preliminaries may be adjusted, should this offer be accepted at any time previous to the first day of March next.

It is worth remark that every facility is in this case offered to New York, over Virginia, in having water carriage the whole distance to Baltimore; whereas the Virginia Bullock must travel by land .- Editors Nat. Intel.

It is worthy of observation as illustrating the progress of Internal Improvements, and the facilities of transportation, that, should the above challenge be accepted by a Grazier residing in the Western parts of the State of New York, his bullock might be brought to Baltimore with more ease and despatch than the Virginian's, from a distance of near two hundred miles. A fat heavy bullock coming by land, will not travel more than five miles per day—whereas the New Yorker would put his in a canal boat, and bring him to Albany-thence to New York in the Steam boat-thence to Norfolk in the steam rig, and thence to Baltimore in another steam boat o that his bullock need not lose a meal, nor

I am informed that the best Jacks, any where on the coast of the Mediterranean, are at the Island of Majorca, (c.) from whence I intend to take a Jack and Jenny to our country. Should nothing occur to prevent our going to Malta, I will bring you, from thence, a Jenny, to pair with your Jack. (d.) In visiting the farms at Minorca, with Mr. Ladio, our consul, who has several of his own, and bestows much attention to farming, I saw two extraordinarily fine mules, and on asking him if I could see the Jack that was their sire, he pointed to a small Jenny that was in the field with them, and assured me that they were the offspring of her and the horse in the adjoining lot, a slender formed animal and not exceeding 15 hands. He also said that all their best mules are from the horse and jenny, and that they are more docile than those from the Jack, (e.) I am assured by those whose information is most to be trusted, that an Arabian horse is not to be found this side of Egypt (f.) and the best Barbs are to be had in Morocco, but the price is from 600 to \$1000, besides a high duty for exportation. I have not seen any of the Mahogany cattle, (g.) such as you mention. The cattle that I have seen in Spain, appear to be nothing superior to ours; nor have I seen any where on the coasts of the Mediterranean, any that appear better than those in America; except a race of white cattle at Naples, used for the draught. I was informed by a gentleman, who, in supplying the government with timber, had used thirty yoke of them for two years, that during that time, they had constantly travelled from twenty to twenty-five miles a day, excepting Sundays and the holidays—the place from whence he drew the timber, being from forty to fifty miles distant from Naples. He said they were the off spring of the Spanish Bull and Hungarian Cow, or the Hungarian Bull and Spanish Cow. They are generally fifteen hands high, their bodies long, thin and deep-legs long-a small light head, a sharp muzzle, resembling the decision of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the tuft of the tail. They are most frequently the object was particularly entrusted, and by worked in the thills of a cart, and are spirited whom the trust was transferred to the Editor of pomestic Animals," and the principles of improving them, by Henry Cline, Esq. an eminent Surjection of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the most satisfaction of the committee of it; to whom vol. 3, page 108, we published the committee of it; to whom vol. 3, page 108, we published the committee of it; to whom vol. 3, page 108, we published the committee of it; to whom vol. 3, page 108, we published the committee of it; to whom vol. 3, page 108, we published the committee of it; to whom vol. 3, page 108, we published the committee of it; to whom vol. 3, page 108, we published the committee of it; to whom vol. 3, page 108, we published the committee of it; to whom vol. 3, page 108, we published the committee of it; to whom vol. 3, page 108, we published head, a sharp muzzle, resembling the deer-colour to suffer from heat, more than a horse. (h.) I would have bought a bull and a cow, had we have to have taken them to Smyrna and the Archi-

country, except at Genoa, where a good cow "2dly. Those from Algiers, of somewhat les gives about fourteen quarts per day, and in Tus"stature and better form and size—and 3dly cany from fourteen to sixteen. (i.) They are a small oak about the size of a large peach tree, and bear very abundantly every year. I have seen no domes-tic fowls equal to those we have, and though I have often been at Malta, I never saw or heard that their geese and ducks were better than those elsewhere, (k.) but should I return there, which I hope to do, I will ascertain the truth. There is promised me some hares and red bill partridges; "obstacle becomes so enlarged as to prevent the large pigeon of Barbary we have on board." procreation." It was to this letter, that we promised me some hares and red bill partridges;

Respectfully yours, JACOB JONES.

Explanations of, and notes on the preceding let-ter, by the Editor of the American Farmer.

(a.) The Agricultural Society of Albemarle, Virginia, impressed with a belief that the Horses of that state would be much improved by the introduction of the ANDALUSIAN Stallion from Spain, and aware that one could not be obtained without special permission from the King-that difficulty was overcome through the agency of defeated, as they have been fruitless. Yet, how Mr. Madison, who procured the license; but it is it that the race is perpetuated in their native was never used until 1819, when the Society trans- country? ferred it to the Editor of this paper, for whom R. Oliver, Esq. placed a credit in Spain to the ader that the breed, if as valuable as was represented, might be herhetuated in this country. Society-soon after, the Editor opened a correspondence, which has proved to him highly vacure an object so little likely to meet the expec- the grossest prejudices. Com. Jones fully approves this determination—the animal procreated between the Horse and confirming what had been predicted by Mr. the Ass, is much smaller than the mule, and so much to gratify an interest, which may be and the mule retains the dimensions of the mare, taken in it by our readers in general, as to make Hence, he says, that in mixed species the size of record of the course we have pursued, for the the body appears to depend more on the mother satisfaction of the Albemarle Agricultural So-than on the father. In the American Farmer,

THE NAVY .- The attention of its officers to the and have, no where, heard of so much as in our "Horse, long legs, light bodies and slight fleece. "brought to this country. I received, myself, a ram and ewe, brought in one of our vessels "from Tunis direct; but the ewe would never " breed; her massive tail never admitting the commerce of the ram. I have bred from the ram, in and in, for ten years past, with a dif-" ferent race, and have found that when a ewe gets to be about 7-8ths pure blood, the same

> Com. Jones and Capt. Booth, a pair of sheep which answer in form and character to the "Tunis MOUNTAIN-BROAD-TAIL" Sheep, described by Judge Peters, as the best of that race, and to the engraving of them in the Memoirs of the Philadelphia Agricultural Society, with the exception of being, undoubtedly, coarser in the fleece than our common sheep. The ewe has been seen to yield willingly to the ram's essays to embrace her, but it is believed his attempts, have been so far,

The subject is worthy of more extended observation, and we are only surprised, that facts mount of whatever sum might be necessary to so extraordinary, should not have attracted the procure a PAIR of that breed of Horses-in or-more particular attention of professed natural-

(c.) It was here that the fine Jack, Don Car-These documents were all put into the hands of los, was procured, which was lately sold by Pur-Commodore Jones, who offered, most politely and promptly, to execute the views of the Virginia Jefferson County, Va. and which took an honorary premium at the last Maryland Cattle Show.

(d.) The history of this very superior animal, luable and interesting, with a connoisseur of speaks nothing to the credit or discernment of great taste in New York, Charles H. Hall, Esq. the landholders in Maryland. Sancho was brought on the subject of domestic animals generally, and from the Mediterranean by the late Capt. Gorespecially the Horse. Mr. Hall had himself don—was badly kept and estimated on the Easbeen concerned in the importation of several tern Shore of Maryland. The Editor hearing of horses of this particular race, and his views and him, gave \$500 for him, and placed him on his opinions, founded on personal knowledge and ob- Stock Farm. He was offered to the public use, servation, were altogether so pointedly unfa-vorable and discouraging, and his reasoning so from one neighbourhood to another, and not conclusive, that we determined to present them more than eight mares were offered for his serto Commodore Jones, and to countermand the order, believing that we should not be justified in

"The last accounts we have from the deserts, confirm those of the old travellers, respecting the mode of life of the wandering Arabs, or Bedouins, and their treatment of their cattle; in the present day."

"The finest and most valuable races of Horses, as the Arabs pretend, for more than those countries, which were distinguished by the same superiority more than the accuracy of an account like this, in an affair self-for the ceremonal of an entertainment in an their treatment of their cattle; in and uncontaminated by any alien mixture or fact, the customs of these people seem as stable and permanent as the very earth on which they are superiority more than the accuracy of an account like this, in an affair self-for the ceremonal of an entertainment in an their treatment of their cattle; in and uncontaminated by any alien mixture or fact, the customs of these people seem as stable and permanent as the very earth on which they are superiority more than the countries are superiorit country, although we have long since excelled in lions, and mares, are generally known among the latter, mares and foals, men, women, and the breeders of that country, as among the children, take their rest promiscuously; and oft-breeders of Race-horses in this; but they carry their scrupulosity and precaution for based as their scrupulosity and precaution for their scrupulosity and precaution for based as the scrupulosity and precaution for ba whole family, quadruped as well as biped, eat, "The Spanish Horses of the present time, of which I have seen some of the best specimens, are of a larger breed than of old, and appear to have a considerable mixture of the Northern blood, the foundation of which change might, produce."

The Spanish Horses of the present time, of who give a solemn certificate of the consummation, signed and sealed in the presence of the serted, that the mares and foals, will not only permit all kinds of play from the children, but the foundation of which change might, produce. The names and permit all kinds of play from the children, but the laid during the connexion of their models. This corrected with control of the contr blood, the foundation of which change might, pro-bably, be laid during the connexion of their mo-narchy with the Empire of Germany."

"The Spanish resemble some of the English half and three part-blood Horses. The head ra-ther large and coarse, sometimes Roman-nosed;

These vouchers, like the title-deeds of an estate, with similar faculties of good nature and intel-

to avoid hurting inferior animals. She would ley, camel's milk, and perhaps dates. race and gambol, and play with me, or with her groom, in the field, like a favourite Spaniel; and most simple, and many ride, as has been said, when mounted on her, I was assured in case of in the primitive style, without either bridle or accident, I had nothing to fear, either from af-fright or carelessness, far less vice in her; and I have no doubt, had I ever fallen from her, and my foot hung in the stirrup, that she would have instantly stopped, until I had extricated myself; whole foot, the toe of the stirrup iron being in truth, I owed much, perhaps my life, to her care. Horses are confirmed in this way, by kind They use no girths, ride excessively short, and and considerate treatment. The Arabians treat are expert in all those feats of horemanship the horses, habitually, even with the utmost which depend on the equilibre and which has fondness, having neither the desire nor the ne-sessity of beating them, the generous and docile animals, do every thing which is required of them, in consequence of indication and persua-sion:—hence, probably, the kindness and generosity of temper supposed to be inherent, and a characteristic in the Arabian horse.'

"It is remarkable, that we have, in all probability, derived from the Arabians, the common custom of throwing water upon the back of the mare, the instant of the descent of the horse.* They have another custom of shearing off the hair of their foals at eighteen months old, in order to promote its growth. At two years old, or two years and a half, at longest, the foals are taken in hand and taught their duty; and those horses, or rather mares, (for the Arabs, like their forefathers, and for the same reasons it is said, always prefer mares) are constantly kept bridled and saddled at the door of the tent, throughout the whole day. It has been said, that they are, in that place, made fast by one of the fore legs, and that the leg becomes often stiffened, or injured, in consequence."

e

d

* Naturalists tell us that ardour of temperament in the male, so necessary to successful sexual embraces, is hurtful in the female, and almost always prevents conception-hence the custom of inflicting blows, and "throwing water" immediately on the consummation of the act upon the crupper of the she ass, which is represented as amongst the most lascivious of all animals,-in the case of the dog and the cat, yet more ardent, nature has provided a peculiar structure of the machinery of generation, which prevents the retreat of the male until the convulsions of the internal organs have had time to be appeased. We would have the reader to recollect, that some views of natural history connect themselves with the leading topicks of this Journal. In fact, we mean to make natural history itself, one of its leading features, and of course we are sometimes forced to have recourse to illustrations of a character that we would otherwise avoid-we must endeavour to employ terms the least offensive, to make ourselves understood, and trust for the rest to the good sense of those who choose to follow us in our investigations—we are conscious of the best intentions, and "hont sois qui mal y pense."

ligence, and have repeatedly witnessed her care year, they are supported on barley straw, bar-

"The horse furniture of the lower classes is saddle: but amongst the superior, the Turkish saddle is in use, having the posterior part, or cantle, so high, as to reach half way up the rider's back; and flat stirrups which contain the which depend on the equilibre, and which have been already adverted to, in the practice of the ancients.'

"Here follows an Arabian pedigree, which was hung about the neck of the horse. Various old pedigrees of Arabians are in print; this is probably the latest, the horse being brought from Egypt with our troops, a few years since,

sire, of the tribe Zazahalah; he is finely mould-word had not come from Europe along with many ed, and made for running like an ostrich, and others equally inapplicable. ed, and made for running like an ostrich, and others equally inapplication.

great in his stroke and his cover. In the honours of relationship, he reckons Zalicah, sire of Mahat, sire of Kellac, and the Unique Alket, sire of Manasseh, sire of Alsheh, father of the race of wegetation, to a summer, which, in an instant, creates swarms of insects, or warms down to the famous horse, the sire of Lahalla; and them into life, sets the sap in rapid motion, and the same abundance of green meat, and corn. tribe."

(g) Purser Hambleton had mentioned to the Editor, a beautiful race of milk cattle in Italy, of mahogany colour.

(h) This is the valuable breed of a bull and cow imported by Com. Bainbridge, and now the property of John Middleton, Esq. of S. Carolina, where undoubtedly constitute one of the most valuable hot-bed, made on the 19th of March. The hot-acquisitions ever made in the Southern states, bed had six lights altogether, and was about of the Editor, who became convinced by person-these cabbages was only four feet by three and a al observation that for activity and adaptation to half. The plants came out of this bed on the all kinds of farm labour, and for capacity to 20th of April, and were planted three inches withstand the heat of a Southern climate, they lully justify the character here given by Com. I light with a cloth. On the 20th of May, they Jones—the colour, form, and texture of their were planted out in the open ground; and, on the light with a cloth. On the 20th of May, they lightly indicate these capacities—we repeat the 17th of Lyne we began to eat them. All fully tested.

(i) With respect to cows for milk, we have nothing to gain from abroad—except, perhaps, the Ayrshire cow of Scotland, mentioned by Sir John Sinclair.

(k) We had been told they were of superior quality at Tricete, by Major W. B. Barney.

THE AMERICAN GARDENER;

Or a Treatise on the Situation, Soil, Fencing and Laying-Out of Gardens; on the making and Managing of Hot Beds and Green-Houses; and on the Propagation and Cultivation of the several sorts of Vegetables, Herbs, Fruits and Flowers.—By WILLIAM COB-BETT.

(Continued from page 299.)

CHAPTER II.

On the making and Managing of Hot Beds and Green-houses.

HOT-BEDS.

63. I am not about to lay down rules for persons who can afford to have cucumbers in March. This amounts to something little short of folly in England: in America it would be something worse. But, Hot Beds, as things of real use, are more necessary in America than in England: because in the former country, the winter will not by Col. Ainsley:—

"In the name of God, the merciful and compassionate, and of Seed Mahommed, Agent of plants the winter will suffer to exist in the open passionate, and of the companions of Major in England. The American Spring bears no air in England. The American Spring bears no air in England. hommed and of Jerusalem. Praised be the Lord resemblance to that of England, which comes on the Omnipotent Creator. This is a high-bred by degrees from the end of February to the behorse, and its colts'-tooth is here in a bag, hung ginning of June : while the American Spring about his neck, with his pedigree, and of un-doubted authority, such as no infidel can refuse. There is in fact, no Spring: there is a Winter, to believe. He is the son of Rabbamy, out of a Summer and an Autumn, but no Spring; and the dam Lahahdadah, and equal in power to his none would ever have been thought of, if the

own to the famous horse, the sire of Lahalla; and to him be ever abundance of green meat, and corn, and water of life, as a reward from the tribe of the gayest verdure; this sudden transition presents the gardener, or the farmer, with ground travellers, of half a bushel of well sifted barley to each nag, given in a bag which is left fastened to the head. In March, the grass season in those countries, the horses are either soiled at home, or turned loose into the pastures, whilst the grass lasts, which cannot be long in such a climate. During the other seasons of the Netwerliets tellus that ardour of temperament. yards of their sheep and pigs. In the summer (a cruelly dry one) of 1819, who, within many miles of my house in Long Island, had a loaved cabbage, except myself? During June, July and August, I allowed fifteen a day for my own family: I gave ten a day to one neighbour; to others I gave about five hundred, perhaps, first and last; and, the plants were all raised in one we hope they will be properly estimated, as they single light, four feet by three and a half, on a undoubtedly constitute one of the most valuable hot-bed, made on the 19th of March. The hot-These cattle were some time in the possession twenty feet long; but, the part appropriated to skin, all indicate these capacities—we repeat the 17th of June we began to eat them. All the hope that they may be duly appreciated and these cabbages, Early Dwarfs, Early Yorks, fully tested.

Sugar Loaves, and Battersea, (coming in one sort after the other) amounting to about four thousand in number, stood, when planted out, upon rather less than thirty rods of ground; and he earliest sorts, while we were using them so iberally, were selling in New York market at from 6 to 4 pence a piece.

ber of plants, or, indeed, any number, however prepared. I suppose a three-light Frame, four small, is a work of great difficulty, and is mere-feet wide and nine feet long, which, of course, ly chance-work after all. Besides, fall-sown plants will make every Light three feet wide and four are not so good as spring-sown. They become long; because, the long way of the light fits, stunted; and they very frequently go off to seed, of course, the cross way of the Frame. instead of producing loaves. However, it is not my business to treat here of cultivation: I am here to speak of the Making and Managing of hot-beds. This must, of course, include a description of the Wood and Glass, when formed into Frames and Lights. But, first of all, I must the Frame itself, and place it on the shot which and made it level and smooth, you may sow your treat of the making of the bed.

66. The materials of which the bed is to be composed, and the manner of preparing those

materials, are first to be spoken of.

67. Dung of horses, cattle, sheep or pigs, used to make the bed of. Either may be made to do, with a greater or less degree of care and trouble; but, the best possible thing is dung from the stable, taken away before it has been rotted, short and long promiscuously, but rather long than short. If there be a large proportion of short it may have any litter added to it; any broken straw or hay or corn stalks, in order to make a due mixture of long and short.

68. This choosing of the materials being a very important point, I shall, in order to make my instructions clear, suppose a case, and such a it is practicable to make it. case as will be very clear to every American

Farmer.

69. By the month of March he has always a heap of dung, which has, from time to time, been thrown out of his stable, during the winter and fall. This is some long and some short. Let of a gardener scorns such assistance; but it is the whole of this (supposing there to be three very useful to persons unused to the work. horses kept) be taken; and, in addition, a pretty 74. Thus, all being prepared, you begin magood wagon load of long stained stuff from the king the bed. Begin taking the dung on the heap, near where you are going to make the bed. are building the bed. Keep taking up clean to Then begin on one side of it, and take the stuff the ground. Have shovel as well as fork. Take and begin making a fresh heap of it. Shake long and short fairly, and mix them well as you every fork full well to pieces, and mix well the long with the short; and thus go on, till you not to suffer any lumps. Shake every straw from

three days in this state; that is to say, four clear the whole down with the fork as you proceed. days after the day of making the heap. Then When you have shaken on dung to the thickness turn the heap back again; shaking all well to of four or five inches, beat all over well again; and pieces, as before, and bringing to the inside that so on, till the work be finished. But mind : you part of the stuff which was before on the outside must be very careful to keep the edges of the bed of the heap. Let it remain now three clear well beaten; or else they will be more hollow, days after the day of turning. Then turn it and will sink more, than the rest, and then the

state, it is fit to make the bed with.

as directed below; but I must first describe the upright, and smooth and neat as a wall. As you Frame and the Lights. Were I speaking to per-proceed, measure the height frequently, in the sons living in a country, where there is no such different parts of the bed, to see that you are thing as a hot-bed frame, I should be obliged keeping the height every where the same. At will endure. I have always observed, that the to enter into a detailed mechanical description. last, shovel and sweep up all the short earthy But, as Frames and Lights are to be seen in almost every considerable town in America; and, was, and lay it very smoothly on the top of the as I have known very few American Farmers, bed; and make all as smooth and as level as a who are not able to make both with their own die with the back of your shovel. hands, without any help from either carpenter or glazier, it will be necessary merely for me to say, that the Frame is of the best shape when it upon the Frame. If you finish your bed by sink as it heats; and will, at last, come to about a is eighteen inches deep at the back and nine noon, the heat will begin to rise by the next morn-inches deep at the front. This gives slope enough, ing; and by the noon of the second day after inches deep at the front. This gives slope enough, ing; and by the noon of the second day after but, it will give a great heat for about six weeks; and especially in a country where there is so little rainy weather. The Frame is the wood work, on which the Lights, or glass-work, are laid. There needs no more than a good look at a thing of this sort to know how to make it, or that is to say, if you cannot endure the heat; that vegetation advances with rapidity.

If the heat be so great as to burn your finger; that is to say, if you cannot endure the heat; that vegetation advances with rapidity.

80. Having secured the bottom heat, make the noon of the second day after but, it will give a great heat for about six weeks; and same heat for four months. It is this bottom heat that makes things grow. The sun is often hot in May; but, it is not till the earth is warm that vegetation advances with rapidity.

80. Having secured the bottom heat, make then it is too great to receive the earth; but, if free with the air. Even before the seeds begin not, put on the earth all over the bed. If the

65. To preserve during Winter, such a num-the Lights ready, I shall suppose them to be heat be too great, give the bed a little air and

72. Now, then, to the work of making the bed The front of the bed is, of course, to be full South, so that the noon sun may come right upon the glass. The length and width of the bed hands; for hands are the only tools used in a must be those of the Frame. Therefore, take hot-bed. When you have stirred the earth well, the glass. The length and width of the bed you mean the bed to stand on. See that you have it rightly placed; and then, with a pointed stick, make a mark in the ground all round the outside of the Frame. Then take the Frame away. Then take some sharp-pointed straight stakes, and drive them in the ground, at each corner of this marked-out place for the bed, and one or two on the back and on the front side. Let these be about four feet high. They are to be your guides in building the bed; and, they ought, therefore, to be very straight, and to be placed nerfectly upright. Each stake may be placed about an inch further out than the mark on the ground; for fear of having the bed too narrow; though, observe, the bed should be as nearly the same length and breadth as the Frame as

73. In order to begin the work well, it is a very good way, to put some boards on their edges, on the ground, at the ends and sides, on Broadbrim himself, if he saw a pretty girl and the insides of the stakes; so as to have a sort of an ugly one stuck in the mud, would not give his open box to begin to make the bed in. The eye

cow-yard, or sheep-yard. Toss it down in a side of your heap nearest to the spot where you put them in. Shake the stuff in such a way as have the whole in a round heap rising to a point. every other straw. Let the bed rise in all parts 70. The second day after this heap is made together as nearly as possible. That is to say, it will begin to send forth steam. Let it remain do not put much in one part at one time. Beat again; shaking well to pieces, as before, and bringing again the outside stuff to the inside. Beat them well; keep them well up as you proceed; When it has remained two clear days in this state, it is fit to make the bed with. 71. In the making the bed you will proceed of the fork. And, in short, make the sides proceed, measure the height frequently, in the stuff round the bed and where your dung-heap

75. Thus the bed is made. Then put on the Frame, and fix it nicely. Then put the Lights

wait till a little of the heat be gone off.

76. The earth should be dry; not like dust; but not wet. I made provision for my bed, by putting earth in my cellar, in November. It is not much that is wanted. The bed is to be covered all over, about six inches deep. When the earth has been on twenty four hours, take off the lights, and stir the earth well with your seed, if you do not find the earth too hot. But, observe, the earth is to be level, and not sloping, like the glass. The glas is sloping to meet the sun, and to turn off the wet; but, the earth must lie perfectly level; and this, you will observe, is

a very great point.

77. Next comes the act of sowing. The more handsomely this is done, the better it is done. A handsome dress is better than an ugly one, not because it is warmer, or cooler, but because, liking it better, being more pleased with it, we take more care of it. Those who have seen too or three women together, crossing dirty streets, or in danger from horses or carriages, where the volunteer assistance of men became useful; those philosophers, who have been spectators of scenes like this, cannot have failed to discover, that humanity, like smoke, is very apt to fly to the fairest; and I much question whether Nicodemus Broadbrim himself, if he saw a pretty girl and hand to the former. He would hand them both out to a certainty; but, he would extricate the pretty one first. There is a great deal in the look of our gardens and fields; and, surely, in so diminutive a concern as a hot-bed, all ought to be neat and regular. Seeds are great tell-tales; for, when they come up, we discover all the carelessness that may have prevailed at the sowing of them.

78. When you have taken off all the lights, make little drills with your finger, from the back of the bed to the front, half an inch deep and about an inch a-part. Make them equi-distant, parallel, and straight. Then drop in your Cab bage seeds along the drills, very thin; but, twenty seeds, perhaps in an inch; for, some will not grow, and some may be pulled up when they appear. It is better to have rather too many than too few. When you have dropped in your seeds all over the bed, and distinguished the several sorts of Cabbages by names, or numbers, written on a bit of paper, and put into the cleft of a little stick, stuck in the ground; then cover all the seeds over neatly and smoothly. Put on the lights; and look upon your spring work as

happily begun.

79. But now we come to the management of a hot-bed. And, observe, that the main princigreat and prevalent error is an endeavour to ob tain, by exclusion of air, something to make up for the want of bottom heat. It is not thus that nature operates. She gives the air as well as the heat; and, without the former she gives nothing. I suppose the hot-bed, made as above, to be about four feet high, when just finished. It will foot and a half. Its heat will gradually diminish; but, it will give a great heat for about six weeks; and some heat for four months. It is this bottom heat that makes things grow. The sun is often

it be very cold weather indeed. The usual way than under a wall, or even a house. A wall will of giving air is by bits of thick board, cut in the not save your ears from the sharp winds so shape of a triangle, or rather, like a wedge, broad effectually as even a thin hedge. The American plant is one of the most useful purposes, to which at one end, and coming to a point at the other. farmer knows well the warmth that walls of a house of the most useful purposes, to which is lifted up either at back or front of Corn Stalks afford. Each light is lifted up, either at back or front of Corn-Stalks afford. the frame, as the wind may be, and the wedge, or tilter, as it is called, is put in, to hold the light up. But, if more air be wanted, the lights may be shoved up, or down; and, in a fine day, actument of the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the aforementioned bed is parallely and the supposition that the supposition t ally taken off.

will leave in the frame from twenty-five to thirty prevented it from freezing on that quarter. Some thousand plants. If you want less, sow in wider sheaves might, besides, if necessary, be laid against the bed itself. But, observe, you must things, give air enough. Do not attempt to make the plants grow fast. You are sure to destroy them, if you make this attempt. Have patience. The plants will be ready soon enough. Get them. The plants will be ready soon enough. Get them distance from the bed.

In the North West winds, and If it come down to fifty at night it is better. If you cannot keep it down to sixty without giving a little air at night, give it, by putting something under a light, or two lights, to let in a little of the cold. For, always bear in mind, that, when plants will be ready soon enough. Get them distance from the bed.

The plants will be ready soon enough. Get them distance from the bed. strong and green; and, to do this, you must give them flenty of air. Remember, that, out of a plants. I suppose the seed to have been sown thousand failures in hot-bed culture, nine hun-on the tenth of March (Long Island, mind,) and

three inches by three inches. Lay a bed of other side of the posts. Thus you will have a pets, or with a slight covering of any sort, space of three inches wide, all the way along, take off again at sun-rise in the morning. between these opposite rows of strips. Then take fine, long, straight Broom Corn Stalks, and fill up this space with them full and tight, putting them, fence will look very handsome, it will be a shelter much more effectual than pales or a wall; and, in my opinion will last as long as the former, subject of Cabbage Plants; because I am to subject of Cabbage Plants; because I am to which is a square. At this point is a stout ring, unless the former be made wholly of Locust. Stalks, rushes, reeds, straw, twigs, bows, any thing of this kind, formed into a fence, or put up as shelter, is preferable to any thing smooth and my work, to confine myself to the making and the rim round the bottom is made of iron or of wood. Any glaas shelter, is preferable to any thing smooth and my work, to confine myself to the making and these hand-lights, and they are solid. Grass will shoot earlier under a bush, managing of Hot-beds; and, I have selected the

81. When the plants come up, they will soon made in some open place. In this case it will attempt to bring Cucumbers and Melons to fruit tell you all about air; for, if they have not be necessary to use some precautions as to in a hot-bed: but the plants may be raised there,

deprived of air, will drop down and die. Take made into the bed, it must, in case of very sharp annual flowers and of Green-house plants may be care in time to prevent this. Let them grow frost, be covered, especially on the North and strong rather than tall. Short stems, broad seed North West sides. If it be not, it will freeze on leaves, very green; these are the signs of good these sides, and, of course, it will not ferment. However, this is no troublesome job; you have 82. It will be necessary to water. Take off a light at a time, and water with a watering pot that does not pour out heavily. Water just about sun-set; and then snut down the lights; and the heat will then rise; and make the plants have the management of the plants in a not-bed I shall speak under the soll to throw on a parcel of straw, or stalks; veral names; but on the management of the beds not pour out heavily. Water just about sun-set; and then snut down the lights; some stakes down, four feet distant from the and the heat will then rise; and make the plants in a not-bed I shall speak under the veral names; but on the management of the beds not pour out heavily. When the bed is made, this is what I did. I drove vations, which have a general application.

91. As to heat and air it will demand but the North Side and the West End. grow prodigiously.

I tacked a pole from stake to stake; and then I meter, hung up, or laid down, in the bed, will placed up along against this pole, three or four them, leaving four in an inch; and stir the ground about, at the same time with your finger. This tered the bed from the North West winds, and If it come down to fifty at night it is better. If

dred and ninety-niae arise from the giving of too that you have been very attentive to give air and April and May; and, therefore, somebody should water. By the 10th of April, the plants will always be at hand to attend to the hot-bed. But, the plants out of the bed, I must make a remark patch of green. They will be a little drawn up, some man; or, at any rate, a wife, a son, or a or two respecting shelter for hot-beds; and this leads me back to the Plan of the Garden. In now they must be removed into a new bed. Dig that plan (page 307) is the Hot-bed Ground, No. 1, which is 70 feet by 36. The fence to the North and West is the hedge, and that to the South and East ought to be made of Broom days and have, cover it over with four inches of contract to a series and plants. Fill this hollow up with the best cool. It may loose its heat sooner than you could can't have a real plant to the cool and the sound an bricks, or smooth stones, along the ground from three days from the sun. They must also be post to post, and let this bed be about seven or eight inches wide. This bed is for the bottoms of the Broom-Corn Stalks to stand on. Go on ground on one side of the bed, and the other end one side of the row of posts, and nail three on the other side; put these rods at about two rows of strips, or laths (best of Locust,) to the feet asunder all along the bed; then tie some posts. The first row at a foot and a half from rods long ways to these arched rods; so that, the ground; the second row at six feet from the when you have done, your bed has an arch over ground; and the third row within six inches of it formed by these rods. Every evening about the top of the posts. Then do the same on the sun-set, cover this arch with mats, with old car- heat as you may want. pets, or with a slight covering of any sort, which

88. To put out all your plants in this way will require a very long bed, or many short ones. If, therefore, your number of plants be very large, the best way will be to put out a part of them in of course, bottoms downwards, and placing these the best way will be to put out a part of them in bottoms upon the bricks. When the whole is this way, leave the remainder in the hot bed a things, called hand-lights or hand-glasses. A and without any covering.

90. But, a Hot-Bed may be applied to many the supposition, that the aforementioned bed is raised in this way. It is not worth while to enough, they will draw up long-legged, and will shelter.

and afterwards put out in the ground with great have small seed leaves, and, indeed, if too much 86. While the dung is working, before it be advantage in point of time. Several sorts of got forward by a hot-bed, which, without it, can hardly be got at all to any great degree of perfection. Of the management of these sorts of plants in a hot-bed I shall speak under their several names; but on the management of hotbeds, there yet remain to be made some obser-

91. As to heat and air it will demand but little attention to manage well. But a little Thermo-

92. When the Sun comes upon the glass, it soon augments the heat; and the air must be given immediately if possible, so as to keep down the heat. Changes are very sudden in March, some man; or, at any rate, a wife, a son, or a daughter. The labour is nothing, the trouble

South and East ought to be made of Broom dung you have, cover it over with four inches of wish, especially if you use it for Cucumber and Corn Stalks, in this manner: Put some Locust- good earth; and plant your plants upon it in Melon-plants after you have used it for things Posts along at eight or ten feet apart. Let rows four inches a-part, and two inches a-part in that you want earlier; and, I shall show, that these posts be ten feet high and squared to the row. When you have put out the plants, this may be very useful in certain cases. Now. water them lightly; and shade them for two or if the heat be too much diminished, you may three days from the sun. They must also be easily restore it, thus: make a little narrow hotbed, a foot and a half wide, all round the bed. Put the dung together as before; place it close to the bed; beat it well; and build it up, all round, as high as the top of the Frame. This is called lining; and it will give the bed nearly as much heat as it had at first. If you do not want so much heat, line only the back of the bed; or the back and the two ends. In short, take as much

94. Before I dismiss the subject of hot beds, I must notice, that there are other contrivances than frames resorted to in this kind of garden work. A frame is, as we here see, a wooden construction, for lights of glass to be placed on. nicely filled, strain a line from top of post to top of post, and according to that line, cut off the tops of the Broom-Corn Stalks; and, while the beds of fine rich earth, in the natural ground, ground to the eves. The roof rises from each and without any covering. side in a triangular form, so that it comes to a 89. Now, here we drop, for the present, the point at the top, as a pyramid does, the base of

No. 1, is the Hot bed Ground. It is seventy feet so high and its affinity for moisture so small, that long and thirty-six wide. It is wide enough to contain four rows of hot-beds, with room for linings. But, though a tenth part of this should not be wanted, the place is a warm place, and is No. 1, is the Hot bed Ground. It is seventy feet so high and its affinity for moisture so small, that not be wanted, the place is a warm place, and is better for tender things than a colder place. The its antisceptic powers,*) it becomes so hard as to Wheat was ploughed in for several years in Linentrance to it from the Western door of the resist the roots of vegetables, consequently this colnshire as a manure but ultimately given up, as garden is convenient for the carrying in of dung, is the most useless of all soils. This is a sheltered tion on any thing which comes in contact with spot; and, it will, by and by be seen, that, even if not used for hot-beds at all; such a spot must them. The different acids formed in the process be of great utility.

(To be Continued.)

AGRICULTURE.

DEAR SIR, December 8th, 1822. am directed by the Delegation of the united Agricultural Societies of Va. to request that the six pieces now sent you, may be published in the American Farmer.

Respectfully yours' &c.
EDMUND RUFFIN Sec'y.

To JOHN S. SKINNER.

PAPERS DIRECTED TO BE PUBLISHED BY THE DELEGATION OF THE UNITED AGRICULTURAL HELD IN THE TOWN OF PETERSBURG, ON WEDNESDAY THE 7TH INSTANT.

No. I. A Communication from Dr. WILLIAM J. COCKE, read before the Agricultural Society of Sussex,

on the 14th of May, 1822. Wishing to elicit from others information on the following subjects, I am induced to offer for the consideration of the Society the following crude observations on, THE PROPER TEMPERA-TURE OF SOILS: THE COMPARATIVE ADVANTA-GES OF GREEN OR DRY VEGETABLE MATTER PLOUGHED INTO LAND, AND THE APPLICATION OF ALL OTHER VEGETABLE AND ANIMAL MA-NURES.

Proper Temperature of Soils.

As far as my limited researches into the Science of Agriculture have extended, I have not been able to find a single instance in which, the proper temperature of Soils has been the particular subject of any essay-nor has the subject excited that degree of attention which in my humble opinion it eminently deserves .- It is universally agreed, that a portion of heat is essential to the melioration of all soils, and the growth of every vegetable; but what that degree is, has not yet been ascertained.

The estimated temperature of the Earth is very pointedly, the opinion, that the more putreupon iglass is so slight, they cannot be more expensive than in England; and there they do not cost much more than a dollar each. They but as the three kinds of Earth, Silicious, Calcasoil, the greater will be the advantage gained by may be made of almost any size. About 18 reous, and Aluminous, which are considered neinches square at the base is a very good size. In
cessary to the formation of perfect soil, differ
Just the reverse of this opinion, we find from the gardens near London there are acres of materially in their powers of conducting the the pen of Judge Peters, as expressed in the sethe gardens near London there are acres of ground covered with such glasses. It is the custom there to plant out cauliflowers in the fall, and to cover them, in severe weather, during swinter, with hand-glasses. A hand-glass may, in April, be put over a hot-bed made with a wheel-barrow full of dung. It would bring on cabbage plants enough for two or three gardens. It is handy to sow things under in the natural tor; and their affinities for moisture seem in the spring especially flowers that are to be ground covered with such glasses. It is the principle of heat, (or Caloric,) we may rational-ly infer, that wherever the composition of the Memoirs of the Philadelphia Agricultural Society, and the opinion of the application of green vegetable matter and quick for the melioration of green vegetable matter and quick for the melioration of the soil.

In the Elements of Agricultural Chemistry, by Sir Jumphrey Davy, we find the following obsertor; and their affinities for moisture seem in the natural tor; and their powers of conducting heat. It is handy to sow things under in the natural tor; and their annutes for in the spring, especially flowers that are versely with their powers of conducting heat. "employed for enriching a soil they should be round, in the spring, especially flowers that are From this circumstance we may conclude that "pleughed in, if it be possible, when in flower or adds to the heat in the day, and keeps off cold neither of the three can be left out of a soil with-

95. Now, look back at the Plan of the garden. predominates in a soil, its temperature becomes and for carrying it out again for the use of the which clay predominates to excess becomes so cold and moist that vegetable matter ploughed note by the American Editor. 96. Here would be room for a great deal more into it remains so long without fermenting, as to beds, certainly, than can ever be wanted even in be nearly useless to the succeeding crop. To this superior condition of much of the old tillage a gentleman's garden. But, observe, the room is it may be said, that a soil composed properly of "land of Pennsylvania may be fairly attributed" of fermentation are left free in the soil and act the farmer, who reads for his improvement, at a manifestly to the disadvantage of all vegetables loss to which side to give credence; nor can his fit for the consumption of man or animals. Water own experience settle the question, until he has is likewise a very bad conductor of heat, so much fairly experimented on every variety of soil that so, that a soil retaining an undue quantity, becomes cold and sterile.

Dry or Green Vegetable Matter Ploughed into Land.

attention of Farmers than this, particularly in mometer, and the disposition to fermentation inthis part of the country, where we are compel-creases with increased temperature until the led to depend principally on the spontaneous pro-temperature arises to 90 degrees. Sixty-seven duction of the soil for the nourishment of the future crops; and there is no subject treated of, SOCIETIES OF VIRGINIA, AT THEIR MEETING in the books on Agriculture, which I have had an which fermentation would go on to the greatest opportunity of reading, on which there is a great-er contrariety of opinion. From the pen of Col. Should this and the John Taylor, who may be justly considered the true, we may conclude, that whenever the temfather of Agriculture in this state, we find the perature of the soil rises above the standard (or

and evaporation, in a degree so far below the ever it falls below the standard temperature, it to wood, the longer it will last, and that the but incorrect in a general point of view, as a nearer it approaches to water the shorter it standard from which a farmer should draw his will last. If this principle is sound, a point of opinions for the management of his farm. great importance to the enclosing system is settled: whether it is better to plough in vege-nions to the test of one experiment—on two pictures is a contract to the enclosing system is settled: whether it is better to plough in vege-nions to the test of one experiment—on two pictures. tables in a succulent or dry state? Every experiment I have ever made, decides in favour light soil, and the other a close cold adhesive of the latter; and these decisions correspond soil: on each of these a quantity of dry vegetawith the requisition of our theory."

The foregoing extract from Arator, conveys,

at the time the flower is beginning to appear, and slight frost in the night. Air is given, by putting a brick, or bit of wood, under one of the sides of the hand-glass.

"at the time the flower is beginning to appear, out injuring its aptitude to the retention of a due "for it is, at this period, that they contain the largest quantity of soluble matter, and that their largest quantity of soluble matter, and that their leaves are most active in forming nutritive." matter."

This sentence is immediately followed by a note by the American Editor. "Very different

In the foregoing extracts we find evidence on both sides of this important question which leaves comes under his management, without having reference to the principles heretofore laid down.

Vegetable matter (other circumstances being favourable) will commence fermentation at the But few subjects deserve more extensively the temperature of 55 degrees of Fahrenheit's Therand a half is the middle of these two extremes; which we will take as the standard degree at

Should this and the foregoing propositions be following remarks. Arator, pages 88 a d 89. No. 18. 67 degrees) it will be necessary to plough the Wood and all the vegetables of softer tex- vegetable matter into the land-in that state, (dry,) ture, are exposed to the effects of putrefaction best calculated to resist fermentation, and whenwater, that a complete dressing of atmospheric- will be best to plough it in, in that state (green) al manure conveyed in the vegetable vehicle, which is best calculated to promote fermentation. This brings us to the conclusion, that all the conveyed in rain will disappear in a few weeks. This brings us to the conclusion, that all the tollows that the pears the respect to the conclusion opinions heretofore quoted are correct as far as It follows that the nearer the vegetable vehicle they were governed by the particular soils and of manure from the atmosphere, approaches circumstances under which they were formed:

bles was put, under circumstances as nearly equal as I could make them, and they were both tended in corn in the same way. The corn on the light land was immediately benefitted and continued to improve throughout the year, whilst

^{*} This power seems to be reversed when the quantity does not exceed 15 or 20 per cent.

that on the other received no apparent benefit, it is equally our duty and inclination to succumb as a yearling, but ever after he will be superior; nor has the land of the last been benefitted on a ratio half equal to the first.

In the last Farmer a letter was inserted from I see no advantage in it. Mr. Rhodes says, that

on the application of all other Vegetable and Animal Manures.

In the last Farmer's letter was inserted from I see no advantage in it. Mr. Knodes says, that a late number of the London Farmer's Journal Herefords do not acquire so great a stature, or on the comparative qualities and merits of the lay on flesh so fast as the Short-horns. As proof "Improved Short Horn" and "Herefordshire" is better than assertion, I hereby challenge Mr. "in which manure ought to be ploughed into our hands a reply to the communication just nothing but straw till the latter end of February, "land, whether recent or when it has gone "through the process of fermentation, and this through the process of fermentation, and this not as old as the process of the strain is still a sphilar of discount of the latter and the through the process of fermentation, and this question is still a subject of discussion; but cates. Moreover we have these identical breadth of the winner, for fifty guineas, "question is still a subject of discussion; but whoever will refer to the simplest principles of cates. Moreover, we have these identical breeds provided the cow shewn by Mr. Rhodes is as old now in our country, in the hands of Williams as mine (14 years); and that the acceptance of this ject. As soon as dung begins to decompose, it sylvania—Lloyd in Massachussetts—Powell in Pennsylvania—Lloyd in Massachusetts—Powell in Pennsylvania—Lloyd in Massachu "ject. As soon as dung begins to decompose, it throws off its volatile parts, which are the throws off its volatile parts, which are the most valuable and the most efficient.—Dung which has fermented, so as to become a mere soft cohesive mass, has generally lost from one third to one half of its most useful constituent elements: it evidently should be applied as soon as fermentation begins, that it may exert soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins, that it may exert so the soon as fermentation begins to decompose it and soon be for sale, and the trucky. Their offspring will soon be for sale, and it is but fair that before the publick make into the cow has not been more than one week afsured and the most valuable and the ter this letter and that the treatment is not valuable and the ter this letter and that the treatment is not valuable and the tr "soon as fermentation begins, that it may exert paid, unless their owners are expected to under-cattle of the Herefordshire breed, one is naturalvalue the objects of their own enterprise and publick spirit.

Edit. Am. Farmer.

ON MR. RHODES'S LETTER.

I NEVER remember to have read any thing in stance I conceive to be the temperature of the soil, nature's great laboratory, and it is to this we may attribute the great diversity of opinion on this otherwise simple subject. But however diversified this opinion may be, we can discover a beautiful concatenation of idea in the several authors on Agriculture. Thus wherever one authors on Agriculture. Thus wherever one authors diversified the use of green vegetable matter, covered and a half, during walked out about an hour and a half, during which time I shewed him above a hundred beasts. I do not recollect that he touched more, than one or two, saying, he knew but little of the matter himself, and that he relied entirely on matter himself, and that he relied entirely on the judgment of Mr. Rhodes, in your last paper.

From the tenour of that epistle, any one would which time I shewed him above a hundred beasts. I do not recollect that he touched more, than one or two, saying, he knew but little of the matter himself, and that he relied entirely on pains in the investigation of the peculiar qualities of the two celebrated oreeds, which he wished to pany he would visit me again, when they would recommends the use of green vegetable matter, covered and showe all that it was his own unbias the letter of Mr. Rhodes, in your last paper. recommends the use of green vegetable matter, compare, and above all, that it was his own unbihe will likewise recommend the use of well rotassed opinion which he gave. Now I challenge assed opinion which he gave. Now I challenge dry vegetable matter he will advise undigested manure.

This is extensively shown in the writings of Judge Peters, and Col. John Taylor, the first recommending green vegetable matter and well rotted manure, with other means of promoting decomposition, such as lime, burning, &c. which shews that it is necessary to encourage decomposition, which he gave. He says "I on the comparative merits of these rival breeds."

assed opinion which he gave. Now I challenge Mr. Rhodes to deny, that the comments he has made on both breeds were furnished by Mr. Whittaker, who happened to be at Cheltenham; in their return from which he gave. He says "I on the comparative merits of these rival breeds." shews that it is necessary to encourage decomposition on his soil: whilst on the other hand, Col. Taylor recommends dry vegetable matter, and undigested manure, shewing that the land on which he operates has the power of rotting whatever is ploughed into it to excess, which whatever is ploughed into it to excess, which enders it necessary to make use of such applications as are best calculated to resist fermentation and evaporation.

The foregoing observations are respectfully submitted to the consideration of the Society, under the hope that some member more competent will improve upon them, by

WILLIAM J. COCKE.

his own opinion which he gave. He says "I with the says in the committee of the camination of the says in the question," &c. "I last year made a tour into the Orotting at the North, and am now returned from a similar properties of the Hereford cattle, I shall make the North, and am now returned from a similar properties of the Hereford cattle, I shall make the North, and am now returned from a similar properties of the Hereford cattle, I shall make the North, and am now returned from a similar journey of five hundred miles in Herefordshire," &c. "Nothing short of a personal examination," &c. "I last year made a tour into the visit of the Hereford cattle, I shall make to show that the hasty view these gentlemen to show that the hasty view these gentlemen to show that the hasty view these the hasty view these the hasty view these the show that the h his own opinion which he gave. William J. What must be his astonishment on learning, that instead of this being the case, he had been reading the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of a Yorkshire Farmer, who is a great breeding the opinion of the discussion besides mysel

cattle—which went to declare and establish a Rhodes to shew a Short-horned cow, from any preference of the former. A subsequent arrival part of England, against a Hereford out of my brings that Journal of a later date, and puts into own stock, that laid abroad last winter, and eat ly led to suppose that he passed a considerable time in that county; however, I believe the fact to be, that he spent but one day in the investi-RHODES'S LETTER.

Lynch Court, near Leominster,

Oct. 12, 1822.

An evening at my house. Mr. Rhodes wrote to say, that he and Mr. Whittaker would come to me on a certain day: gation of their merits, with the exception of to me on a certain day; at the time ap-pointed, Mr. R. arrived alone, (Mr. Whittaker having made an engagement elsewhere); he Vour Journal that created so much astonishment arrived about dinner time; in the evening we was the letter of Mr. Rhodes, in your last paper. on the comparative merits of these rival breeds.

family in this city, and is pronounced superior tolviously dipped in a small portion of oil; this any other. Whoever makes the experiment, process is asserted to afford the best defence will never afterwards use bakers' bread when from the destructive influence of air and humithis kind can be had. Independent of a great dity .- Ibid. saving, the bread is spungy, light, and remarka-bly sweet. The expense of baking is nothing to those who use cooking stoves.

1st. Take equal quantities of mealy potatoes

and superfine flour.

2d. Peal and boil the potatoes, using the same water to mash them in; which should be done as fine as flour.

3d. Add, (for three common loaves,) a table spoon full of fine salt, and sufficient yeast.

4th. Mix the bread, and let it rise; bake it about one hour gradually.

LARGE CATTLE.

The New-Haven Register of Saturday mentions, that a few days previously, three oxen passed through that city, on their way to New York, which weighed, according to the patent scales of L. Bishop, Esq. as follows, to wit-3080 -2570-2546. These oxen were raised and fat-tened by Col. Chapin, of Springfield, Mass.— Those cattle, we are this morning informed, have arrived in this city, and will be exhibited a few days, commencing to-morrow, at the building in Broadway, near the intersection of Pearl street. We are informed that a year or two ago Col. Chapin sold a pair of oxen in Boston for \$1050, neither of which weighed as much as the largest of the first mentioned oxen. It remains to be seen whether the New-Yorkers will be as liberal as the Bostonians. About ten days since, the mate of the largest of these three oxen died, and more than 300 pounds of rough tallow was taken out of him, exclusive of the kidney tallow .- New York paper.

IMPORTANT INVENTION.

A gentleman of this state, to whom this counwork, by the present mode of cutting and shearing, the Filly and gives a quantity of milk. Thus there is a saving of 19-20ths of the labour To the best of my knowledge, it has been eight the fur cut by this machine, is pronounced, by years ago since she had a foal, and the last one good judges, to be better than that cut in the was the mother of the Filly which she is now usual way. FROM THE LONDON FARMER'S JOURNAL. ON PREPARING SEED WHEAT. Close House, County of Durham, Sept. 29, 1822.

SIR. I beg to inform your agricultural readers, that have a second time tried an experiment in preparing wheat for seed, and now wish that the result may, through the medium of your valuable paper, be generally known, as it has been attended with considerable benefit. Instead of stale urine, I used whale oil, and afterwards dredged it well (asusual) with slacked lime: three gallons is quite sufficient for a quarter, and may be laid on best from the gardener's watering pan. The seed ought to be well stirred both before and after liming. The expense is trifling, and I am certain black eyed, 55 to 60 cts.—Clover seed, \$9 to 10—will be attended with the most beneficial results.

The seed is enriched thereby and no wished cts.—Whiskey from the seed, 75 to 80 The seed is enriched thereby, and nourished, and that too in a more certain way than by manure, and at the same time less expensive. The ear is stouter (as may be found on comparison,) the crop more abundant, and every way superior. I am, Sir, your obedient servant, JOSEPH FAIRBURN.

A FILLY SUCKLED BY HER GRAND-DAM EIGHT YEARS AFTER HAVING HAD HER LAST FOAL.

Pleasant Plains, near Annapolis, ? August 24th, 1821.

J. S. SKINNER, Esq.

Dear Sir,-I have taken the liberty to inform of April, I had a fine promising Filly foaled, seven sons; price of which, bound, \$5 per vol. or \$4 weeks after, the mother died; I then thought best in Sheets : A gentleman of this state, to whom this country is much indebted for his former inventions, to raise her by hand, but finding her rather lone-ladelphia. has lately completed a machine for cutting fur from skins, without injury to the Pelt, which has having use for the Horse, I took him out, and WELLS & LILLEY, Boston. heretofore been rendered useless for leather. It is then put a Mare in his place; in the course of PETER COTTOM, Richmond, Va. also ascertained, that this machine will shear cloth two days, my servant came to me, and said, that E. THAYER, Charleston, S. C. much better than any machine now in use. One the Mare had milk, and the Filly had been suck- JOSEPH GALES, Raleigh, N. C. man can cut, with this machine, the fur from 1000 ing. I went immediately with him to the lot, The fourth volume, now publishing, can be skins per day, or shear 2500 yards of cloth—and to convince myself of the fact, I made him forwarded to any part of the United States, on whereas the cutting of the fur from 50 skins or milk her before I left him, as I was a little application being made, by letter or otherwise, to shearing 150 yards of cloth, is considered a day's doubtful of his word. The Mare is now raising

Or a Treatise on the Situation, Soil, Fencing and Laying-Out of Gardens; on the making and Managing of Hot Beds and Green-Hous-es; and on the Propagation and Cultivation of the several sorts of Vegetables, Herbs, Fruits and Flowers.

(Continued from page 304.)

CHAPTER II. CONTINUED.

ON THE MAKING AND MANAGING GREEN-HOUSES.

97. My object is not to treat of any thing very exhensive or very curious. There are persons, whose taste greatly differs from mine in regard to say that mine is the best. But, I can treat of nothing that I do not understand, that is to say, of nothing with regard to which I have not had experience. My study, as to gardening, has always been directed towards things that please the expert in vegetables things that please the the senses: in vegetables, things that please the halate, and that, to use the common saying, are good to eat: in shrubs and flowers, things that delight the sight or the smell. Mere botanical curiosities, as they are called, I never took delight in. If the merit of a plant or a flower is nothing more curious in one plant, or flower, than in another. They are all equally curious; they are equally objects of wonder. There is more of rareness, in England, in the Indian Corn than in the Cowslip; but here, the Cowslip would have the merit of rareness. The ice-plant, the egg plant, and many others, have oddity to recommend them; but, after all, oddity is but a poor recommendation. What are thousands of these when compared to a single rose bush in bloom!

They are all equally curious; they the things that delight us through life; and you will find, that ninety-nine out of every hundred are derived from women. To be the object of are derived from women. To be the object of no woman's care or good wishes is a sentence the most severe that can be pronounced upon man.

109. I have, in paragraph 21, mentioned, incidentally, wooden boxes, as things wherein to place plants; but, I must here caution the reader against the practice, wherever it can be avoided, penters and glaziers are never wanted, and, where these when compared to a single rose bush in bloom!

Locust wood, for the pot, and, or course, a third part wide than the bottom of the pot. This pan when the things that delight us through life; and you will find, that ninety-nine out of every hundred are derived from women. To be the object of no woman's care or good wishes is a sentence the most severe that can be pronounced upon are derived from women. To be the object of no woman's care or good wishes is a sentence the most severe that can be pronounced upon are derived from women. To be the object of no woman's care or good wishes is a sentence the most severe that can be pronounced upon are derived from women. To be the object of no woman's care or good wishes is a sentence the most severe that can be pronounced upon are derived from women. To be the object of no woman's care or good wishes is a sentence the most severe that can be pronounced upon are derived from women. To be the object of no woman's care or good wishes is a sentence the most seve

98. I am rather anticipating here; but, I wished to explain why I do not recommend any very great pains in the affair of a green-house. The *plants* to keep in such a place I will talk of hereafter. At present I am to speak of the making and the managing of such a place.

99. A green-house is for the purpose of having plants and flowers flourishing, or at least, in verdure and in bloom in winter. The best place for a green-house, is, near the dwelling house, and, it should be actually joined to the dwelling house, one of the rooms of which should have windows looking into the green house, which lat-ter, however, must face the South. When the thing can be thus contrived, it is very pretty. It renders a long winter shorter in appearance; and, in such cases, appearances are realities. A door, opening from a parlour into a green-house, makes the thing very pleasant; and especially in a country like America, where, for six months, every thing like verdure is completely absent from the fields and gardens. And, if the expense be but small, such a pleasure may, surely, be afforded to the females of a family, though, to afford it, may demand some deduction in the expenditure for the bottle, in the pleasures of which (if, alas! pleasures they be!) the amiable ladies of this country do not partake.

100. I hope, that no man, who has the means what use is beauty in a horse, a house, or in any thing else? Of what use are sporting dogs and guns? The use of these things, is, that they could be from the frost. Air is given by pushing up, or were of deal. If tubs, or boxes must be resorted give pleasure; that they render life pleasanter drawing down, the Lights, which form the top to, they ought to be of Locust, or some other

other recreation.

101. Let me not, however, in using these arguments, be supposed to doubt of the disposition of American husbands to gratify their wives in the supposed to doubt of the disposition of American husbands to gratify their wives in the supposed to doubt of the disposition of American husbands to gratify their wives in the supposed to doubt of the disposition of American husbands to gratify their wives in the supposed to doubt of the disposition of American husbands to gratify their wives in the supposed to doubt of the disposition of pulling down, the lights at top. light in. If the merit of a plant or a flower is bear a comparison with America. This is, too, painful examination, it has always appeared to me not worth the looking for. There is, in fact, nothing more curious in one plant, or flower, than in another. They are all equally curious; they

thing as a green-house be!

103. In America there must be heat; but, how in the coldest weather; and, if the green-house we e on the Eastern side of the dwelling-house, the cold would not be any great annoyance. But, at any rate, the heat necessary to keep out frost might easily be obtained. A Thermometer

kept up; and a green-house might be made one of the most beautiful and most pleasant things in the world.

105. Of the different plants suitable for a

than it would be without them. And, why not, or roof of the green-house. Always give air on the same principle, call a green-bouse useful? when there is no fear of frost. Give heat and Of what use is money, that thing which every one seeks to possess? Of what use indeed, but to be expended on things, which tend to make life easy and pleasant? Therefore, a green-house comes fairly within the scope of useful-ness; for from it the females of a family would instead of a delight to the beholder. If the sides ness; for, from it the females of a family would instead of a delight to the beholder. If the sides receive constant amusement and delight, during and front, as well as the top of the green-house, a season when they are cut off from almost all be of glass, (which is best,) then air may be gi-

this respect; for, many and striking as are the the Americans call jars. Perhaps I may as well traits, that distinguish the American character, speak, once for all, about the shape and size, and none is so striking, and none exalts it so much, manner of planting in, these pots. The shape is as the respect and deference of the male towards the female sex. They talk to us about French to be glazed. Plain earthen pots are best as well holiteness; and we hear enough of the sentimental trash of romances, where Princes and of the bottom of every pot, or no plant will live Nobles are the heroes. But, in no part of this in it for any considerable length of time, and will whole world are the women so kindly and so res-never grow in it at all. This hole should be in pectfully treated by the men as in America. Proportion to the size of the pot; and the pots Here women, in no state of life, are treated badly or churlishly. To insure indulgence, assistance, forbearance, from every man, and under any forbearance, it is sufficient that the party is a smallest hole ought to be of the size of half a more any forbearance. It this respect to country or early will delay.

Locust wood, for the sills, is every where to be had, and glass with scarcely any tax, how elegant, how cheap, and how durable, may such a Large Myrtles, and other large exotics are planted in tubs. There would be great difficulty in getting earthen things of sufficient dimensions for easily will any of the ingenious men in this country find the means of furnishing the necessary breaking. But, I am quite satisfied, that where heat with hardly any expense or trouble! In most earthenware can be got and used, it is greatly cases the warmth might go from the parlour fire preferable to wood; and this opinion is founded place; for, all that is wanted is completety to keep on actual experience. In my hot-bed of 1819, I out frost. There is, here, no want of Sun even sowed several sorts of seeds in little wooden boxes. I had no pots at hand, and to get them from New-York required more time than I was willing to spare. The seeds all came uh; but, by the time that they were an inch or two high, they rotted at the stem, and fell down. There were not less should be kept in the green-house. The heat should be about sixty degrees in the day time, and twenty sorts of seeds; some of culinary veshould be about sixty degrees in the day time, getables, some of field plants, and some of forest-trees. They all died. In one box there were planted some geranium-cuttings. They came their green-houses, except in very cold weather, out into bud and leaf; but died soon afterwards. which, indeed, they seldom have. Their great I had soon afterwards got some *ftots*. I repeated want is that of *sun*; for, nothing will do well my sowing and planting; all the seeds and plants without sun; and America has plenty of this grew and flourished. And, let it be observed, even in the coldest weather. So that, if the frost that the boxes stood in the same bed, where cabwere effectually kept out, that alone would give bages and cauliflowers were sown without either beautiful plants in winter. By an additional pots or boxes; and that the plants of these grew, heat, a growth and a bloom would be constantly and flourished exceedingly. The cause of the plants rotting in the boxes was this; though there were several holes at the bottom of each box, and though these were properly covered with oyster-shells, the wood itself, sides as well as bottom, to provide such pleasures for his wife, or daugh ters, will talk to me about the useleseness of a green-house. Of what use then is fine linen, when coarse is cheaper and will last longer! Of as to management, which are applicable to the from the watering of the bed also. There was

110. Some care is necessary in sowing and ry injurious to every kind of plant. planting in pots. The mould should be good, 114. These two instances will s and made very fine. The first thing is to put an operation of sowing and planting in pots; for, to the pot, to cover the hole at the bottom; and the or smaller, than those here mentioned, the princihollow part of the shell, or other thing, should ple is the same, and the difference in minute parhole open, that the water may find its way out of you have stocks, or other little things, to transthe pot, and not lie stagnant at the bottom, where plant into pots, you will nearly fill the pot with would be, at once, removed by having a greenit would become sour and injure, if not kill, the earth, and then make holes with a little stick, house. Once the articles were placed properly plant. The earth, if there were no shell, would or with a finger, to put in the roots; and then in that, the process of drying would be completed fill up the hole, and, would, in time, become solid, proceed as before, and settle down the earth. and thus prevent the water from getting out. The such little things, being nearly all juice, will respect to obtain even an imperfect operation in the shell, or broken earthen ware, keeps the earth quire water directly, and shading for a day or hollow, and the water creeps under the edges of it, and thus escapes into the pan, whence it evaporates. In fields, we always desire an open by-and-by, when I come to the cultivation of the several sorts of plants and flowers.

115. The benches of the green-house remain the crops stunted and looking yellow, where there to espoken of. They should rise one above and the fruits, or cakes, put upon these boards. Is a bottom of clay, while, at the year same time another, like the steps of a stairs, that the whole Being shut in neither raise nor dewe could effect is a bottom of clay, while, at the very same time, a bottom of sand, gravel, lime stone, or other often matter, exhibits them green and flourishing. It is upon this principle, founded on experience, that holes have been made in the bottom of the bottom o flower-pots. The uses of pans are, first, to pre- The arrangement ought, however, to be such as even in the vulgar sense of the word, as well as vent the water from running about the places to make it convenient to get at every pot; not ornament, in a geeen-house. But, I must conwhere pots are placed; and next to hold the water only for the purpose of watering, but for that of the purpose of watering, but for the purpose of watering, but for that of the purpose of watering, but for the purpose of watering, but for that of the purpose of watering, but for the purpose of watering wateri little longer than it would otherwise remain up stirring the earth frequently round the stems of Mistress of the mansion; to her, who has so

quantity is to be reckoned by gallons, the la-boar cannot be great; and, the desire to possess green-house plants necessarily implies pleasure, rather than pain, in employing the means to obtain them. In order to make myself clearly under the plants come out of this their winter their respective callings; the former contending serve) the plants come out of this their winter their respective callings; the former contending tain them. In order to make myself clearly under the plants come out of this their winter their respective callings; the former contending abode. How they are then to be disposed of that the planting of the garden took place before derstood, I shall suppose an instance of sowing

and one of planting.

112. Suppose you have the seeds of Stocks to sow. Put earth into the pot enough to fill it to Then take the pot in your two hands, and give five of Flora. or six gentle taps with the bottom of the pot upon the ground, or upon a block, or some solid thing. This settles the earth down; and it needs no pressure the ten proper solid the ground, or upon a block, or some solid thing. This settles the earth down; and it needs no pressure at the ten proper solid thing. The settles the earth down; and it needs no pressure at the ten proper solid thing. which has been raised from a cutting, and the root of which cannot be very large. Put some earth on the pot. Hold the root of plant upon it to see that it will be of the right depth, if its root stand on that earth. Then, when you have got the earth to the right height, hold the plant with one that it will be of the right height, hold the plant with one that it will be of the right height, hold the plant with one that it will be of the right height, hold the plant with one that it will be of the right height, hold the plant with one that it will be of the right height, hold the plant with one that it will be of the right height, hold the plant with one that the right height, hold the plant with one the right height, here the right at the right with the right height, here the right at the hand, and fill up the pot, round the plant, with Rosemary, one of Lavender, a root of Hyssop, the taste is fixed at once, and it remains, to the other. Then, tap the bottom of the pot on Thyme, Penny-royal, some Mint, and, indeed, the exclusion of cards and dice, to the end of earth, as before, an inch lower than the top of grown in the garden, would be useful, as well as the pot. Put the pot in the pan; and, in this, pleasant to the eye, during winter.

123. This is, with me, far more than sufficient to outweigh even a plausible objection on the score of expense. Such husbands and fathers as that a plant in a pot has not an under-soil and green-house, the latter is of use. An excellent are accessible by arguments like these, will need the part of plants are on the drawing of plants are nothing more to induce them to yield to my redews and a mass of fermenting earth to supply place for the drying of cherries, apples, pears, it with moisture, as a plant in the open air has, quinces, peaches and other fruits; and also for Yet, even in the case of pots, it is best, unless the drying of yeast-cakes, one of the most useful the plant be of a very juicy nature, to suffer the ground to get dry at top before you water; be-ever invented.

hard and close wood. Locust is best, because cause, water falling upon freshly-moved earth, 119. All this work of drying can, indeed, be imperishable. See paragraph, 16. always makes it bake hard at top, which is ve-performed by the help of the fine hot sun, in the

there be beauty without cleanliness?

serve) the plants come out of this their winter their respective callings; the former contending will be treated of hereafter, under the head of the sewing of the fig-leaves together; and, the flowers; where it will be seen, that the green-latter contending, that there was no gardening at house, besides being a most charming object in all, till Adam was expelled and compelled to winter, when all without is dreariness, is the best work; but, that the sewing was a real and bona sow. Put earth into the pot enough to fill it to security for giving you a beautiful garden in fide act of tailoring. This is vulgar work to be within an inch of the top, and make the top of the earth very smooth. Then scatter your least, a hot-bed, it is quite impossible to have in persons, when they have Lord Bacon to furnish perfection, either in America or in England, them with a precedent? some earth over the seeds to the depth of about certain plants and flowers, some of which are some earth over the seeds to the depth of about certain plants and flowers, some of which are half an inch. Make the top very smooth again, the very greatest beauties of the beautiful family writers, SIR WILLIAM, who so ardently and yet

After this settling, the top of the earth should be and kept green and growing in the green-house rents in almost every thing. How much better, about an inch lower than the top of the pot; else during the winter. Some Herbs dry well; but, during a long and dreary winter, for daughters, you could not, when necessary, give water; for none of them are quite so good as when green; and even sons, to assist, or attend, their mother the water would run off, there being no place to and, as to Parsley, which is wanted almost in a green-house, than to be seated with her at every day in the year, it loses all its virtue in cards, or at you of the more innocent, more the drying, smell and all. Six large pots of conceived! How much more innocent, more the drying, smell and all. some solid thing, as before mentioned, leaving the of every pot and medicinal Herb, that is usually life.

gardeners, who came to England in the reign of James the First (cap. 18), it appears that hops hops are generally esteemed; the former owe Henry the Eighth, might have brought over then produced in considerable quantity in their superiority solely to the excellent mode of some hop-plants, with other roots and seeds, and that we availed ourselves of their manner of cultivating this bitter herb. From them, it appears that hops possessed delepears, we also derived the name, which, in the possessed delepears, we also derived the name, which, in the last the possessed delepears, we also derived the name, which, in the last the possessed delepears, we also derived the name, which, in the last the possessed delepears to prevent their being put into hear the possessed the possessed the possessed delepears, we also derived the name, which, in the last the possessed delepears to prevent their being put into hear the market, and next to them the Sussex to them the Sussex to them the put the market, and next to them the Sussex to them they have a generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe hears that hops hops are generally esteemed; the former owe pears, we also derived the name, which, in High Dutch, is Hopfen; and Hoppe, Hop, and Hoperuut in Dutch.

The first English treatise written expressly on the culture of hops, was by Reynolde Scot, printed in 1574, in 63 pages, black letter, entitled, " A perfite platforme of a Hoppe Garden." He com-plains that "the Flemmings envie our practice herin, who altogither tende their owne profite, seeking to impownde us in the ignorance of our commodities, to cramme us with the wares and fruites of their countrie, and doe anye thing that may passed in the 6th of George the Third, certainty of a crown and the many combinations which makes it a forfeiture of five pounds per that are required to produce so good a one, are us with the discommendation of our soyle, obscuring and falsifying the order of this mysterie, same act, the maliciously cutting hop-bines, planter is richer than his neighbour, notwith-sending us into Flaunders as farre as Poppering around the control of the sending us into Flaunders as farre as Poppering around the control of the sending us into Flaunders as farre as Poppering and falsifying the order of this mysterie, same act, the maliciously cutting hop-bines, planter is richer than his neighbour, notwith-sending us into Flaunders as farre as Poppering around the control of the sending us into Flaunders as farre as Poppering and falsifying the control of the sending us into Flaunders as farre as Poppering and falsifying the control of the sending us into Flaunders as farre as Poppering and falsifying the control of the sending us into Flaunders as farre as Poppering and falsifying the control of the sending us into Flaunders as farre as Poppering and falsifying the control of the sending us into Flaunders as farre as Poppering and falsifying the control of the sending us into Flaunders as farre as Poppering and falsifying the control of the sending us into Flaunders as farre as Poppering and falsifying the control of the sending us into Flaunders as farre as Poppering and falsifying the control of the sending us into t sending us into Flaunders as farre as Poppering, growing on poles in any plantation, is made felofor that which we may finde at home in our own

Gerard, who wrote on this plant in 1596, says, the control of the Excise. By 9 Anne, cap. 12, spring, and they are also subject to various other "It ioyeth in a fat and fruitful ground: it pros-

those which climbed to a greater height; and we from these stalks. notice, that in all other fruits those nearest the more sun at twenty feet from the ground than it as asparagus; they are an agreeable vegetable, would at six feet. If the poles were placed slop- and esteemed good to purify the blood in the ing, with horizontal and perpendicular props, the vine could still extend itself without being so subject to tempest. The position of these ranges of trellis poles could be so fixed as to admit the sun and air more freely; the tying and gathering would be more easily accomplished; and it is a curious circumstance in the natural history of this plant, that the vine always takes one direction in winding itself round its pole, regular-ly ascending from the right hand to the left: this, in trellis work, would avoid confusion or crossing of vines, which is injurious to all plants.

To describe the present manner of cultivating, gathering, drying and bagging of hops, would be repeating what may be found in every Encyclopedia, and work on agriculture, without ad-

ding entertainment or information.

The hop plantations in Sussex have increased from about 5400 to 9500 acres within these last fourteen years, as appears by a statement from the Board of Excise, which was ordered by the House of Commons to be printed in May, 1821.

In a country where malt-liquor forms the general beverage of the greater portion of its in-habitants, it becomes a matter of no small importance to know, that the hop contains an aperient, and diuretic bitter, which makes our beer more salubrious, whilst its balsamic flavour makes it more agreeable, and combines with these advantages, that of preserving the liquor by its agreeably oderiferous principle, which prevents the necessary fermentation from going beyond due bounds.

"The ale," (says Parkinson in his Theatrum Botanicum, published in 1640,) "which our forefathers were accustomed only to drink, being a kind of thicker drink than beere, is now almost quite left off to be made, the use of hoppes, to be put therein altering the quality thereof, to be much more healthful, or rather physicall, to preserve the body-from the repletion of grosse hu-

mors, which the ale engendered."

Ground Ivy, called Alehoof or Tun-hoof, Glechoma hederacea, was generally used for preserv

ing beere, before the use of hops was known.

Horehound and wormwood, &c. &c. have been used as a succedaneum, when hops have been dear. Some authors recommend hops against the stone; others doubt their utility in that com-plaint; but it has been remarked that since hops have been more generally used fewer persons la-

of, are thought good against pestilential fevers; juleps and apozems are also prepared with hops for hypochondriacal and hysterical affections.

"The hop," says Dr. James, " is bitter, detersive, and gives no tincture of red to blue paper .-By this chemical analysis, a little acid, a great deal of volatile concrete salt, and oil, are obtained from it; which shews it to contain some salammoniac, mixed with some sulphur and earth.

observations which the author has made on a few stalks. In the year following, Mr. Cooksey proplants, which he cultivated for ornament, the duced specimens. In 1791, Mr. John Locket, of flowers were found larger and more abundant on Donnington, near Newbury, in Berkshire, had the vines that were trained horizontally, than on the premium adjudged to him for cloth made

NO. II. On fallowing for Wheat-On the plan of husbandry, best adapted to the light soil of the lower part of Virginia, Ge. Ge.

BREMO, 21st December, 1820.

Your's of the 2d December, did not reach me, until within a few days, from the circumstance of its not being sent to my usual post office .-This will excuse me for not being more prompt in my answer to you. The consciousness that you have counted too largely, upon the information I am able to impart, on the various agriculthe production, but it may be assured, that the tural subjects referred to in your letter, and the land is left in much better heart after a fallow anxious desire, I feel to encourage the spirit of crop than after wheat, succeeding corn; when enquiry, which seems to be spreading itself the last, however, has credit by the greater quan amongst the cultivators of every section of the tity of grain yielded by the two crops over the State, induces me, the more readily to comply with your wishes, as well, to evince my perfect willingness to contribute what I can in so lands. On the light sandy lands of the lower good a cause, as to apprise you promptly of the necessity of your applying to other and better sources, for the desired information.

Your queries shall be taken in the order in which they are made, and without confining myself to the direct answers, shall add such general remarks as appear to me any way connected with

rural economy.

"The process of fallowing as practised by myself." This is to plough in a crop of clover, as nearly as possible, at that stage of its growth, when it is in the best state for cutting to make hay. Of course, where there is a full portion of your out clover, I should not hesitate to adopt winter rotation in Clover, there can be but a part of fallows, in other words, the English naked fallows your fallews ploughed exactly in the proper time, stirring them with single ploughs thro' the sumwithout extra teams, and unusual seasons. Hence, the necessity of beginning a little before the clo ver has attained the precise point, to yield the greatest advantage from being turned into the earth-and hence too, the necessity of a second ploughing, where your first was early, and the season favourable to vegetation after the process. But I deem it less important to be minute upon have been more generally used.

It is said that the perfume of hops is so salutary, that when put between the outer cover and the pillow, they will procure sleep to those who the pillow, they will procure sleep to those who is a desirable fevers.

It do not think summer to the sandy soils of the lower part of this state.

2. "The advantages as to product of a clover fallow over wheat after corn?" This may be stated to the sandy soils of the lower part of this state.

ing upon the opportuneness and perfection of the process, and the adaptation of the land to the use of plaster of paris. Soils suited to plaster, with a heavy crop of clover ploughed in, at the proper time, previously dressed with three or four pecks of Gypsum to the acre, followed by favourable seasons for rotting the buried clover, and seed two last dry summers, I have known some fields in the Month of October, will rarely fail to give of fallowed wheat almost destroyed by the dry two bashels for one, from the same land, after vegetable matter remaining undecomposed in the

ner of a vineyard, or by espaliers; but by some premiums, in 1760, for cloth made from hop-into which the earth is brought frequently by the summer droughts, will often not yield a better crop, than the same land would produce after

> 3. "The difference in the quantum of labour in fallowing for wheat, and wheat after corn."This can only be decided by referring to the number and kind of operations which are performed in each process, and as these ought to depend in number and kind, upon a variety of circumstances, the relative expense of the two modes of Husbandry must necessarily vary in like manner. Under a fortunate concurrence of circumstances, fallows may be seeded upon the first ploughing, and completed with a single har-rowing; but it often happens, that a second ploughing, and under particular circumstances a third, and two harrowings may be necessary to do justice to the crop. In like manner, a single operation, with a single horse plough, and a slight chopping the step, will frequently do more ample justice to the wheat crop after corn, than under other circumstances will result from cutting up your corn, breaking up with the double plough, harrowing to receive the seed, and sometimes ploughing with single ploughs before the second and last harrowing.

> 4. "The effects as to improvement and exhaustion." These are also much influenced by the circumstances already adverted to as affecting the production, but it may be assured, that the one, it exhibits too imposing a claim upon the score of profit to be given up, even on our clay country, so much better suited to Indian corn, and less adapted to fallows, I am of the opinion, that wheat after corn, is the most profitable and judi-

cious course of Husbandry.

5. "On what soils is the practice of fallows most beneficial?" Wheat soils, or those having a considerable proportion of clay in them. This being the soil, only upon which clover can be profitably and extensively cultivated, I would recommend summer fallows only, where this description of soil was found, and the clover husbandry practised. Upon this kind of land withmer, in preference to depending on a late summer fallow—The influence of the sun on this description of soil recently exposed, is not as injurious as on sandy soils, and by no means equal to the evils arising from the hard and untillable state into which our summer sun bakes it.

The remarks on this head sufficiently express my opinion, as to "the profitable introduction of fallows where a reduced sandy soil and hot sun

precludes clover."

6. "What is the difference of product between wheat after one ploughing on grazed land, and that not grazed, or is either practised." Both are practised, and when the vegetable matter is turned into the earth, in a favourable state for rotting, that is with some remaining succulence, and succeeded by a suitable season to promote putrefaction, the great agents of which are moisture and heat, the more that has been turned in the better the succeeding crop, and the less the injury sustained from its maturation. But in the In Sweden, they make a strong cloth from the Indian Corn,—On the other hand, a crop of clover soil. It seems therefore to follow that the less fibres of the hop-vine, after it has been dressed like flax. The Society for encouraging Arts, powerful sun, and consequently imperfectly for the immediate crop, unless it is prepared by Manufactures, and Commerce in London, offered buried from the hard and unmanageable state, decomposition into the food of vegetable life. 7. As to "the period that land may remain system excluding clover, because from the harmonic process, for improvement, before fallowing ture of your soil, and the generally reduced state without causing the crop to be foul." There is a of the land, the attempt at the field culture, difference of opinion among the Farmers of this upon a large scale, would be attended with no quarter, but I think there is a preponderance in other result but the loss of your seed, and as favor of the opinion, that clover, (we cultivate summer fallows should only be practised as the no other grass,) ought to be ploughed the sum-concomitant of clover, those likewise I should for market, as is contemplated in the forgoing scheme the materials for market, as scheme the materials for market and the materials for market, as scheme the materials for market and the materials for market and the materials for market and the materials for market a no other grass,) ought to be ploughed the summer, twelve months after sowing it, and of course where it is cut at all, the same year of taking off

Edit. Am. Far.

Tulip Hill, on West River, Aovember 30th, 1822.

To Mr. R. Sinclair.

**Dear Sir—I have duly received your letter, and think I can best answer the object of your course of my experiments on the sandy soils of other almost incalculable advantages.

that section of the state, I am satisfied that I did great and lasting injury to some land by ploughing it about six inches deep. This land the acre, below what is necessary to produce the same result on the clay lands, of the upper country—for light lands make a much better return, as succinctly as possible, my thoughts on a plan of Husbandry, united to the light sandy lands of the lower parts of the state. I should adopt a the lower parts of the state. I should adopt a the lower parts of the state. I should adopt a for a small quantity of manure than stiff lands.—I have increased the corn crop 100 per cent. upon the lower parts of the state. I should adopt a for a small quantity of manure than stiff lands.—I have increased the corn crop 100 per cent. upon the lower parts of the state. I should adopt a for a small quantity of manure than stiff lands.—I have increased the corn crop 100 per cent. upon the lower parts of the state. I should adopt a for a small quantity of manure than stiff lands.—I have increased the corn crop 100 per cent. upon the lower parts of the state. I should adopt a for a small quantity of manure than stiff lands.—I have increased the corn crop 100 per cent. upon the lower parts of the state. I should adopt a for a small quantity of manure than stiff lands.—I have increased the corn crop 100 per cent. upon the lower parts of the state. I should adopt a for a small quantity of manure four or five loads to be plough, which I contrived for saving time and labour, and which I contrived for saving time and labour, and which I contrived for saving time and labour, and which I contrived for saving time and labour, and which I contrived for saving time and labour, and which I contrived to the five-furne seed plough, which I contrived for saving time and labour, and which I contrived for saving time and labour, and which I contrived for saving time and labour, and which I contrived for saving time and labour, and which I contrived for saving time and labour, and labour, and labour, and labour, an

7. As to "the period that land may remain system excluding clover, because from the na- 30 bushels each, to the acre, which in their na-

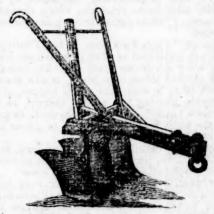

scheme, the materials for manure, would be very Assuming it as the basis of all good husbandry, much increased-and, the frequent recurrence that for every exhausting crop, there ought to be some counteracting improvement, I would cultivate no more land in corn, than I could manure.—
This I think can be effected under a six field ro-

The field in peas, &c. would more than comsecond, wheat; third, pasture; fourth, peas, and all leguminous crops; cotton, pumpkins, and policy tatoes might occupy a corner of this field; five, heat; six, pasture.

The first, and most ostensible objection to this grass crop turned in, on sandy lands, that I know of. counted upon for the improvement of the soil scheme is, the apparent small proportion of corn, where the first crop is taken for hay, and the second for seed; and this too, necessarily limits you to the latest period for the performance of quantity of manure. In answer, it may be fund to an adequate supply, for that field in the fund to an adequate supply, for that field in the rotation which is in the most exhausting of all our crops, indian corn, regular deterioration must ment of the land, and not intended to be cut at that some part of this manure is derived from to amuse ourselves with expedients, practical all, there is little doubt that the best time for other resources than those of the farm; to wit, agriculturists will soon all agree that nothing

JOHN H. COCKE.

THE MAXCY PLOUGH.

R. Sinclair, for sale at Baltimore, at \$12, adapted to three furrows, and at \$18 to turn five furrows: to him we are indebted for the following letter, from its much respected inventor, descriptive of its origin and utility.

inquiry respecting my use of the five-furrow seed plough, which I contrived for saving time

In reflecting, after I became satisfied it was best to abandon the harrow, how a plough might be contrived to save time in seeding, it occurred to me, first to make a double furrow, by attaching two small ploughs together, by means of ciety. In the 4th vol. of the same work may be plough," communicated by James Eastburn. A mistake it is presumed is committed in the name, as it was Jonathan Eastman, now of Baltimore, the ingenious inventor of the best cutting or chaffing box, which I have seen, to whom I required but one ploughman. As it did as its inhabitants. much work as two single ploughs, the same force of men and mules got in my wheat crop in half the time occupied in that operation, previous to my using it.

After succeeding in this experiment, I added third plough, so as to turn three furrows. This implement, of course required three mules; but one ploughman only was necessary. This plough, however, was, from the length necessary to be given to it to avoid clogging, rather heavy and unwieldly. In considering how I might remedy these defects, the thought occurred of forming a Five-furrow plough upon the plan of bls. Pearl at 44s. to 45s. per cwt. the one you saw at West River, which is entirely different from the Draveil, and indeed from any which I have ever seen or read of; and in imitation of which you inform me you have made one for my friend and neighbour, John Mercer, Esq. of Cedar Park. By means of this plough,

I have now had the Five-Furrow plough in use for two years, and my only reason for not having heretofore had more of them made was, that I had in use three of the Three-Furrow, and four of the two furrow Draveil ploughs. As these wear out I shall supply their place by ploughs made upon the plan of my Five-Furrow plough, the principle of which is equally applicable to two, three, four, or even more than five furrow ploughs. A five furrow plough is wide enough to make at one bout, a good land for the cradle, and a plough of six or more furrows would be too heavy and unwieldly for three mules or horses. For cultivating corn, or seeding amongst it, two or three furrow ploughs will be best, and I am glad, that you have thought ter of the 19th ult. containing a sample of Silk well enough of the plan to construct ploughs carrying three as well as five furrows; for new implements frequently get into bad repute, before strong, and of a beautiful colour. If such can promised to send them to Havre by the 10th of a fair trial has been made, from the unskilfulness be made so far North, what greater success have November, which he did very punctually. SILK-MILLET-PEAS-CULTURE OF GRAPES-AND FABRICATION OF WINE

Columbia, S. C. Dec. 6th, 1822.

JOHN S. SKINNER, Esq.

in a crop in this manner, I thought extremely small ones have already occurred to my mind, you were so obliging as to send me, for which

I sent down to Charleston, a few days since, to hands and mules employed. I therefore tried they cannot well be described in a letter. I do I sent down to charleston, a lew days since, to harrowing—but the result of my experience not recollect whether I mentioned to you, that be forwarded to you by the first opportunity, a was, that wheat stood an unfavourable winter in in order to make the five furrow plough run small box containing some Egyptian Millet; 1 our situation near the Chesapeake Bay, where evenly and make all the furrows of equal depth, must call it so, until I know a more proper name our situation near the Chesapeake Bay, where evenly and make all the lurrows of equal tepth, and the solution of each show seldom lies long on the ground, better when it is necessary that the toe or point of each share, as you recede from the foremost one, appearance of the grain, the plants from either the level of the varieties are, as far as I can judge, perfectly should be raised a little above the level of the same satisfied it was similar, and all equally good and abundant for fo Ploughs carrying several furrows do much rage, either to be consumed green or cured like more even work, than single furrow ploughs can. I need I use them on hills as well as level lands. I need found an account of my double-furrow "Draveil per width by one turn of the five furrow plough. common Indian corn. Each stock not only bears I have thus given you a history of my use of the one ear on its summit, but branches out so as to many furrow ploughs. You inform me, that you have as many as eight or ten ears each. To use it made, and took with you to the late Cattle Show, on the Eastern Shore, one of five and another of three mould boards. I am extremely glad to hear late and took with you to the late Cattle Show, for soiling or for winter forage, it may probably be best to cut it when it is about three feet high. In this manner, 4, 5 or 6 cuttings may be of the highly respectable exhibition, which you obtained, according to the length of the season. gave the plough to be presented to the Philadelphia Agricultural Society. This plough differs witnessed there. I had made my arrangements it ought to be planted about the same distance but little from the French Draveil, except in indicators and nothing but the occurrence of as Indian corn, and that which is intended for indicators are not to be cut at all. The time of the construction of the beam, of the foremost plough, from which the wheel is discarded, and a simple beam in the common form substituted. It is not too heavy for two mules. It of course for the understanding the decurrence of seed ought not to be cut at all. The time of planting is as early as there is no danger of frost. As it grows so large, one seed of course, is sufficient in each hill; and when it has come up too thick it is best to roll when it has come up too thick, it is best to pull up all but one plant and transplant them; for it bears transplanting ex;

tremely well, which is a great advantage. You will also find in the box, a small paper of a particular kind of Field Pea. It grows somewhat like the Cow Pea, and is very productive. I had only about a larg ea spoon full of it, and these produced, with scarce y any care, more than one bushel. It will do v well to plant with a corn crop. It would also answer very well for ploughing in green, as the root is small and the plant large, from which circumstance, it is presumeable, that it draws much nourishment from the atmosphere, and will return to the land more than t gets from it. These seeds are, of course, to be distributed, according to your pleasure, to your

agricultural friends.

You request "that I inform you of the fate of you may know, more fully, the reasons of my bad success with them, I shall state all the facts connected with their importation. Thinking it de sirable to have a great variety of vines for experiment, that I might select those that seemed best suited to our soil and climate, I, while in Paris, procured a letter of recommendation to the Minister of the Interior, for the purpose of begging nish me with all the vines I might wish to have, that were in the extensive collection under his superintendance. In this latter gentleman, I also found a person much disposed to do every thing in his power that might be advantageous to the United States, and particularly to the State of South Carolina, where he had formerly resided some time, and had been very hospitably treated. The time of my departure from France being near at hand, I called upon him and requested that the vines might be got ready for me in a few days, to which he objected, as made in New England, and exhibited at the the season (October,) was not sufficiently advanced Brighton Show. The silk is very fine, even, to allow the cutting of the vines with safety; but November, which he did very punctually. Ow-I have also received the Chili Peas and Beans, reciprocally on the ships of the American and

I should be detained in France much longer than it was convenient to me, I sailed a few days before the arrival of the grape vines. They were, therefore, left at Havre until an opportunity offered; and by the time I received them in Columbia, which was the last of April, they had been cut nearly six months, and they appeared to opinions of gardeners on the subject, but was opinions of gardeners on the subject, but was much disappointed in their theory. They at the opinions of gardeners on the subject, but was much disappointed in their theory. They at the opinions of gardeners on the subject, but was additionally the latest period.—

The plan required to prevent this disease, is very obvious, but the accomplishment much more difficult, to check the sap till the latest period.—

But how shall this be done? Will laying the roots bare in February assist? Will ramming snow about them late in winter, and covering that snow to prevent its escape? Will planting some and then in a defect of the fruit; I examined the opinions of gardeners on the subject, but was much disappointed in their theory. They at tributed it to worms about the root of the tree—

264 different kinds, only about 40 vegetated at all, and the greatest number of these so feebly. French nations, I found it difficult to procure a passage to any of the Southern ports, and, lest I should be detained in France much longer than a subject of much regret to me that this great and doubtless, very valuable collection, probably the greatest ever imported to the United States, should have thus almost totally failed north than Maryland. Trees that grow in rich extract of A LETTER TO THE EDITOR. from circumstances not within my control. It can scarcely be doubted, that in this great number of kinds, several would have been found very suitable to our climate, and have proved ulti-mately a most important object in our Southern to see the beautiful emblems of spring enveloped

The little experiment which I have undertaken in our Sand-hills, has been considerably

their appearance, I presume they are found na turally in rich damp soils, like the common Bullace, of which it is evidently a variety. I intend to try them in a suitable soil. It is certainly a rich notion, which most people have in this country, that wine cannot be made without some brandy being put into it. Were they to suffer the grapes, after they are fully ripe and washed, to ferment to a proper degree, there is no doubt that it would keep perfectly well, without the addition of spirits. A little reflection would satisfy any person, that if brandy was absolutely them longer than any, I believe, ever kept in our time, as we have accounts of wine being kept by them upwards of one hundred years. I have drank Champaigne that was thirty-four years old,

DISEASE OF PEACH TREES.

grow. I planted them all, however, and out of tributed it to worms about the root of the tree—
264 different kinds, only about 40 vegetated at now I am certain that not one tree in ten, of all, and the greatest number of these so feebly mine, ever had a worm about them, and morethat I have only 10 or 12 of them alive at pre-sent. These, with about the same number which quate to such a sudden and universal injury. On I had before, make yet a tolerable collection. It is weighing every fact that has come to my knowcultivated ground, such as fine peaches require, will often start their sap, if the weather is very warm for a week, at least two or three weeks before they should. It is no novelty, in this state, in the stern realities of winter-what then becomes of the sap that flowed when such a change of temperature takes place? Will it recede?neglected, in consequence of my having been en-gaged in other and dissimilar objects, and I have not a man to whom I can confide the cultivation ning of the sap, when the weather continues at No, it cannot to any extent. It must either corrupt grape, of which a rich wine can undoubtedly be made, by persons that understand the process well. I have tasted some that would have been very good, had it not been poisoned with apple or peach brandy. It appears to me a very strange observations may determine its period better.—
We may truly say, that a tree is formed the same year that it bears; for all previous layers are as bone in animals, though they may be to your market from this shore next spring. capable of furnishing some nourishment-and when a tree has been completely disappointed in forming its bark, and we see the imperfection of but the wine would be improved in quality, and the fruit, we should not speak unphilosophically if we said that it was the fruit of the previous year out of time. In such cases the tree has borne twice from one set of vessels. The tree necessary for the making of wine, the ancients who knew nothing of distilling, could never have made wine, and we know very well that they not only made wines in quantities, but also kept several strata in the bark, evidently shewing that instead of a layer of white wood every year, which would have taken place if the bark had formed perfectly, that the imperfect vessels had remained with the bark and formed a straand it is well known that this kind of wine is as delicate as any. It was kept in a deep cellar, as all delicate wines ought to be kept. Wine that is bottled properly and kept in a cellar, deep mer year, and in this state of unity the tree is only in health! enough to prevent any exposure to a change of bears the winter, and in the spring the increased temperature, may probably be kept for any length temperature acts on these new formed vessels,

peach, nor pear, nor grape, for all these go the same way.

S. V. S.

P. S. I hope some of our northern orchardists, who lose still more trees than we do, though less infested with the insect, will take up this sub-

EXTRACT OF A LETTER TO THE EDITOR, DATED Rockhall, Md. Nov. 15th, 1822.

Dear Sir,-For some time past, I have had it in contemplation to ask your friendly and ever ready aid, in obtaining correct information respecting some lately invented Threshing Machines in the Eastern States—when, by the last number of the American Farmer, my views have been anticipated by a Mr. Streater, of Pennsylvania. It would be very gratifying to me, and many of the Farmers of this county, to know of the vine. It progresses nevertheless, and pro mises full success.

I have several vines of Scuppernong in my garden, which is a very dry spot, and although they grow well, they bear but indifferently. From the vessels, and these vessels are to perfect the late Brighton Cattle Show, and represented as are imperfect, all that depends on them will be they grow well, they bear but indifferently. From the vessels, and these vessels are to perfect the late Brighton Cattle Show, and represented as are imperfect, all that depends on them will be leng quite portable and of a simple construction. I should be highly gratified to be informed that we cannot so easily distinguish the imperfect. that we cannot so easily distinguish the imper-fection in the blossom; for we know that the freight round to Baltimore? I have had a great blossom is of a hardier nature than either leaf desire to have a machine, by which I could seor fruit, and requires comparatively but little parate the grain, and preserve the straw in its

I am sorry to inform you that the seeds of the tox, and regularly attended to, but all in vain.

Will you likewise be kind enough to enquire through the medium of your paper what method has been pursued with the greatest success, for obtaining a crop of the Crab or Crop grass, when cultivated by itself? At what time the ground should be broke up, and what attendance is necessary, and what has been the produce? This grass is a native, but like many other valuable spontaneous productions, has been sadly neglected. I do not know of a single instance in which it has been cultivated alone; it grows well in our corn fields, but owing to some cause, Lord. not known to me; it has never succeeded when proper season to sow it.

Respectfully yours, &c.
JOHN D. LEGARE.

infirm man needs work as hard as the younger and most robust, and recommending a wheel of a conical instead of a cylindrincal shape, for the end.

whom it may be proper to favour, to tread higher merly dismantled and demolished. in the circumference of the wheel, for as the labour is shortened, measuring horizontally from the axle of the wheel, exactly by so much is the labour diminished. - But it is usual to allow a little rest to each prisoner in his turn, and this is effected by the man who stands outermost at one end of the wheel, leaving it for a time, (i. e.) till that performed a fixed number of revolutions is a moderate calculation, amounts to when the outermost leaves it, and the former 317,347 dollars.—5,446 horses and mules at an when the outermost leaves it, and the former shifting a little to right or left, to make room for him. Thus each man rests in his turn, but never more than one at a time.

C's plan would quite prevent this, and it could not very well be done, were that adopted which I suggested. The better way is to have the wheel so constructed that the labour need in no case be too severe, and to make those who are the most robust, or deserving the greatest pun-ishment, not only tread the wheel, but carry on their shoulders more or less of weight. I have lately turned my attention pretty greatly to this subject, being one of the visiting magistrates of a prison, in which a tread wheel, &c. is now erecting. Your's, &c. P.

THE AMERICAN GARDENER;

Or a Treatise on the Situation, Soil, Fencing and Laying-Out of Gardens; on the making

(Continued from page 310.)

CHAPTER III.

On Propagation and Cultivation in general.

124. In order to have good Vegetables, Herbs, Fruits, and Flowers, we must be careful and diligent in the Propagation and Cultivation of the several plants; for, though nature does much, she will not do all. He, who trusts to chance for a crop, deserves none, and he generally has

125. The PROPAGATION of plants is the bringing of them forth, or the increasing and multiply ing of them. This is effected in several different ways: by seed, by suckers, by offsets, by layers, by cuttings. But, bear in mind, that all plants, from the Radish to the Oak, may be propagated by the means of seed; while there are many plants which can be propagated by no other means; and, certain knowledge.

With regard to Propagation by means other than that of seed, I shall speak of it fully enough under the names of the several plants, which are, as to the way of propagating them, to be considered as exceptions to the general rule. There-fore, I shall, in the present Chapter, treat of propagation by seed only.

126. CULTIVATION must, of course, differ, in

128. We should make sure here; for, what a ting? loss to have late cabbages instead of early ones! 132. There are, however, means of ascertain-As to beans, peas, and many other things, there ing, whether seed be sound, or not, before you cannot easily be mistake or deception. But, as sow it in the ground. I know of no seed, which, to cabbages, cauliflowers, turnips, radishes, let-if sound and really good, will not sink in water. in the order you give for seed. Know the seeds in Paragraph 150.

are of the most perfect shape and quality. In man well, if possible. Speak to him yourself.

133. The way to try seed is this. Put a small the Cabbage we seek small stem, well-formed

TRUE SEED.

degenerate; it may have become mixed, or crossed, not true, have the thing you want.

130. To insure truth in seed, you must, if you to save true seed yourself, is by no means an easy you, and stick to him. But, observe, that no seedsman can always be sure. He cannot raise all his seeds himself. He must trust to others. Of course, he may, himself, be deceived. Some kinds of seed will keep a good many years; and, therefore, when you find, that you have got some very true seed of any sort, get some more of it; me just qualify, here, by observing, that I enter not into the deep question (which so many have get as much as will last you for the number of them into water as before directed. If fifty sink

SOUNDNESS OF SEED.

true to its sort; and, yet, if it be unsound, it will not grow, and, of course, is a great deal worse than useless, because the sowing of it occasions loss of time, loss of cost of seed, loss of use of land, and loss of labour, to say nothing about the some respects, to suit itself to certain differences disappointment and mortification. Here, again, taining this important fact, the soundness, or unin the plants to be cultivated; but, there are some if you purchase, you must rely on the seedsman; principles and rules, which apply to the cultiva-tion of all plants; and it is of these only that I propose to speak in the present Chapter. propose to speak in the present Chapter. (especially if the sowing be extensive) the injury may be very great; and, there is no redress. If a absurd, to prepare land and to incur trouble and expense without duly, and even very carefully, attending to the seed, that we are coincided and to the seed, that we are coincided attending to the seed. expense without duly, and even very carefully attending to the seed that we are going to sow the seed does not come up, what proof have you! You may said; that, with strong heat under, and with such seed was not chilled or scorched, in the ground? That it was not eaten by insects there? That it was not destroyed in coming up, or in germinawas not destroyed in coming up, or in germina-

tuces, onions, leeks, and numerous others, the The unsoundness of seed arises from several eye is no guide at all. If, therefore, you do not causes. Unritheness, blight, mouldiness, and age, save your own seed (of the manner of doing which I shall speak by and by,) you ought to be very first, if excessive, prevent the seed from ever careful as to whom you purchase of; and, though having the germinating quality in them. Mouldithe seller be a person of perfect probity, he may ness arises from the seed being kept in a damp Gardener's business. There are rules applicable be deserved himself. If you do not save your place, or from its having heated. When dried to particular plants. Those will be given in their own seed, which, as will be seen, cannot always again it becomes light. Age will cause the germi-proper places. It is my business here to speak be done with safety, all you can do, is, to take nating quality to evaporate; though, where there of such as are applicable to all plants. every precaution in your power when you puris a great proportion of oil in the seed, this quality chase. Be very particular, very full and clear, will remain in it for many years, as will be seen plants should be selected; that is to say, such as

on the subject, if you can; and, in short, take quantity of it in luke-warm water, and let the loaf, few spare, or loose, leaves; in the Turnip, every precaution in your power, in order to avoid water be four or five inches deep. A mug, or large bulb, small neck, slender-stalked leaves, the mortifications like those of having one sort of basin, will do, but a large tumbler glass is best; solid flesh, or pulp; in the Raddish, high colour cabbage, when you expected another, and of for then you can see the bottom as well as top. (if red or scarlet,) small neck, few and short having rape when you expected turnips or ruta Some seeds, such as those of cabbage, radish, leaves, and long top. The marks of perfection are and turnip, will, if good, go to the bottom at well known, and none but perfect plants should

once. Cucumber, Melon, Lettuce, Endive, and or a Treatise on the Situation, Soil, Fencing and Laying-Out of Gardens; on the making and Managing of Hot Beds and Green-Houses; and on the Propagation and Cultivation of the several sorts of Vegetables, Herbs, Fruits and Flowers.

129. But, besides the kind, there is the genandy others, require a few minutes. Parsnip and Carrot, and all the winged seeds, require to be considered. For instance, you want sugar-toaf cabbage. The seed you sow may be cabbage: it may, too, be sugar-toaf, or well wetted, before you put them into the glass; and the carrot should be rubbed, so as to get off not be true to its kind. It may have become part of the hairs, which would otherwise act a decemerate; it may have become wired overseed the feathers do as to a duck. The seed of Root in generating. And thus, the plants may very much disappoint you. True seed is a great rough things that we sow are not the seeds, but much disappoint you. True seed is a great rough things that we sow are not the seeds, but thing; for, not only the time of the crop coming the cases in which the seeds are contained, each case containing from one to five seeds. Therefore in; but the quantity and quality of it greatly de-pend upon the trueness of the seed. You have the trial by water is not, as to these two seeds, plants, to be sure; that is to say, you will have conclusive, though, if the seed be very good; if there be four or five in a case, shell and all will sink in water, after being in the glass an hour. And, as it is a matter of such great importance. purchase, take all the precautions recommended as to sort of seed. It will be seen presently, that, to save true seed yourself, is by no means an easy matter. And, therefore, you must sometimes purchase. Find a seedsman that does not deceive case and all, after being put into warm water and

134. But, seeds of all sorts, are, sometimes, if not always, part sound and part unsound; and, as the former is not to be rejected on account of the latter, the proportion of each should be ascertained, if a separation be not made. Count then not into the deep question (which so many have puzzled their heads with) of equivocal generation. how many years the seeds of vegetables and confine myself to things of which we have a herbs will keep, see paragraph 150. the sound seeds of which will not sink; but I know of none. If it be found in any instance, they would, I think, be found in those of the Tulip-tree, 131. Seed may be of the right sort; it may be the Ash, the Birch, and the Parsnip, all of which are furnished with so large a portion of wing. Yet all these, if sound, will sink, if put into warm water, with the wet worked a little into the

wings first. 135. There is, however, another way of ascersoundness of seed; and that is, by sowing them. If you have a hot-bed; or, if not, how easy to make one for a hand-glass (see Paragraph 94,) put a hundred seeds, taken as before directed, ple to cause vegetation in a hot-bed, and not enough to cause it in the open air and cold ground. practice, we should reprobate and destroy all

Therefore, the best sand, degrees, from the Early York to the Savoy. shire. "Setting the fruit is the practice of most is, except for things that are very curious, Turnips will mix with radishes and ruta-baga; all these with rape; the result will mix with cabbages and cauliflowers; so that, if nothing were done to preserve plants true to their kind, our gardens would soon present us with little besides

mere herbage.

141. As to the causes I pretend not to dive into them. As to the "affectionate feelings" from which the effect arises, I leave that to those who have studied the "loves of the plants." But, as to the effect itself I can speak positively; for, I have now on the table before me an ear of Indian Corn having in it grains of three distinct sorts; WHITE CORN, that is to say, colcur of bright rye-straw; YELLOW-CORN, that is to say, colour of a deep-coloured orange; Sweet Corn, that is to say, colour of drab, and deep-wrinkled, while the other two are plump, and smooth as polished ivory. The *plant* was from a grain of White-Corn; but, there were Yellow, and Sweet, growing in the same field, though neither at less than three hundred yards distant from the white. whole, or, at least, the greater part, of the White-Corn that grew in the patch was mixed (some ears more and some less) in the same way; and each of the three sorts were mixed with the other two, in much about the same proportion that the White-Corn was.

142. Here we have the different sorts assembled in the same ear, each grain retaining all its distinctive marks, and all the qualities, too, that nate two females!" distinguish it from the other two. Sometimes, however, the mixture takes place in a different way, and the different colours present themselves is made to occupy the time of English Gardeners, in streaks in all the grains of the ear, rendering it may not be amiss to inform him, that those to the colour of the grains variegated instead of

their being one-coloured.

this are never perceived, unless in cases where different sorts of Indian Corn grow at no great distance from each other. Probably, too, to pro-duce this intermixture, the plants of the seve-effect of the application of this "fine fertilizing ral sorts must be all of the same age; must all be "dust." To say the truth, however, there is equal in point of time of blowing and kerning.

But, be this as it may, the fact of intermixture dener. He, in good earnest, believes, that this is certain; and, we have only to know the fact to operation is useful to the growth of the fruit of his induced to take effectual measures to provide his cucumber plants; and, how is he to believe otherwise. against it.

Indian Corn are thus mixed? And, in the Indian will mix, when seed-plants of the same tribe Corn, let it be observed, the ear, that is to say, near each other; and we may easily sup ring on their seed to perfection.

effect is, doubtless, produced by scent, or smell; and gourds, all growing in the same garde for, observe, the ear is so constructed, and is, at the same time? To save the seed of two sor get at the grain, or at the chest of the grain, makes it difficult for any one man to raise all

145. Away, then, I think we may send all the nothing but the rope: a word which, on this occasion, I use, in preference to that of halter, out quence of which erroneous notion gardeners, in many sorts will be perfectly good to the ago of respect for the modern laws and usages of my native country.

The Phænicians, who were the fathers of trade, and the Greeks, who were the sons of art, would, from their intercourse with Egypt, transplant the Gossipium to their own isles.

Pliny says, in his Natural Historyt, that in the higher parts of Egypt, towards Arabia, there grows a shrub and bush that produces cotton, which is called by some Gossypium, and by others Xylon. He says, the plant is small, and bears a Xylum and Gossifium. Serapio calls it Coto, fruit resembling the bearded nut or filbert, out of the inner shell or husk of which the downy cotton breaks forth, which is easily spun, and is superior for whiteness and softness, to any flax in the world. Of this cotton, he adds, the Egyptian priests of old times delighted to have their sacred robes made. This cloth was called Xylina. The same author informs ust, that in an island in the Persian gulf, there were cotton-trees that produced fruit as large as quinces, which opened when ripe, and were full of down, from which was made fine and costly cloth like linen; and that in an island in the same gulf, called Tylos, there was another kind of cotton tree, called Gossampines, that was very productive. Theophrastus also mentions these treess, which we presume to be the Arboreum, or tree cotton, and which seem also the same that Virgil notices:

" Or Ethiopian forests, bearing wool,

'Or leaves from whence the Seres fleeces pull." This species is a perennial plant or shrub, and

long back as 1694.

Nievhoff, who was in China in the year 1655. says, cotten grows in great abundance in that country, and was then one of the principal artiinto that empire about 500 years previously. Siam produces the most beautiful cotton; hose and other articles, manufactured from this down, exceeding even silk for lustre and beauty. The tuguese landed when they discovered the Indian seed of this silky cotton has been sown in the trade. The Spaniards still call it Cullicu. Antilles, where the plants flourish, and yield this delicate floss in abundance.

The Turks have long had possession of that part of the Eastern world, from whence the common act was passed to promote the consumption of cotton springs. They cultivate this annual plant in the neighbourhood of Damascus and Jerusalem, as also in the Isle of Cyprus. It is like-wise cultivated in Candia, Lemnos, Malta, Sicily, and Naples. This variety of the cotton plant is sown in the spring, on land that has been ploughed and prepared for the purpose; and is cut d wn when ripe, in the same manner as our har-vest. The seed of the cotton is about the size of that of tares, and of rather a clammy nature, which causes it to adhere to the downy substance with which it is mixed, and from which it is separated by the little machines, which discharge the seed tians, counterpanes, &c. is now carried on to such consist, but also more firm and stiff than any of by the little machines, which discharge the seed that, to have a little machines, which discharge the seed that, the globulous flesh, it follows that, upon the apon one side, and the cotton on the other. Smyrna an extent, and brought to such perfection, that the globulous flesh, it follows that, upon the apoles that the neighbourhood of Manplication of cotton to a wound, its edges must not alone has furnished us with 10,000 bales of cotton wool per annum. This country formerly took great quantities of cotton-yarn from the Turks; but our manufactories are now so complete, that the neighbourhood of Manchester could supply the whole world with these goods; which, instead of being imported from the East, are at present shipped for the Indies in great quantities. By the aid of our machinest but our manufactories are now so complete, that the East, are at present shipped for the Indies to them to produce new flesh; and that with in great quantities. By the aid of our machinery more ease, as this matter, not having attained we also produce from sort it turned into the ease, as this matter, not having attained we also produce from sort it turned into the ease, as this matter, not having attained enables us to get it turned into thread, both more regularly and cheaper than the indolence of the Turks can furnish it; but we still import some can be made for in linen thread, that it has in cotton-yarn from the Mahometans, which, being great measure superseded the use of real lace. drawn from the distaff, has great advantage over the yarn which is spun by machinery for making tracted genius from all quarters of the nation, to candle-wicks, particularly those of sperm and wax, as the fine threads being drawn straighter, are not so liable to spring out in burning, which causes the candles made of other cotton to are various, in which the arts of the engineer, gutter and burn irregularly.

It appears that we had made some progress in the manufactory of cotton in Queen Elizabeth's reign, as Gerard observes in his History of Plants, "To speake of the commodities of the wool of this plant, it were superfluous; common experience, and the daily vse and benefit we receive ter being stamped with British art and industry. by it, doth shew; so that it were impertinent to our history, to speake of the making of fustain, unmanufactured cotton strikingly evinces the imbombasies, and many other things that are made of the wooll thereof."

did sowe of the seedes, which did grow very

The cotton manufactory alone has raised Manchester from an humble town to a place of the first importance. It has for near two centuries been increasing in size and in trade; and the perfection to which our machinery and the industry of the people have arrived, within these last fifty years, has multiplied the inhabitants, and increased the trade from the supply of its neighbourhood with a few domestie articles, to furnishing the most distant countries, as well as

elegant productions.

Calico, or cotton cloth, is now generally become a substitute for linen cloth throughout the kingdom, not only for the finer parts of female so called from Callicut, a city on the coast of Malabar, being the first place at which the Por-

The demand for printed callicoes becoming common, induced some persons to attempt the art in London, about the year 1676; and in 1722, an our own manufactures, which prohibited the use Old medical authors mention the seeds as being a of foreign calicoes, that were either dyed or good remedy against coughs, and of a singularly printed, to be used as apparel or furniture, under a penalty of five pounds to the informer for every offence; and drapers selling such calico, flammation, when applied to wounds in lieu of forfeited twenty pounds.* The effect of this act linen, by a discovery which he made in examin-

> PAPERS COMMUNICATED FOR PUBLICATION IN THE AMERICAN FARMER, BY ORDER OF THE UNITED AGRICULTURAL SOCIETIES OF VIRGINIA.

No. 3. ing Clover Seed, &c. &c.

I should have replied to your letter immediately on the receipt of it, had not sickness prevented it. I am now better, and shall give such an answer to your inquiries as my experience The following account of a pound weight of and observation enable me to do, without promising you any thing, either new or important, on

> Your first inquiry on the subject of land intended to be fallowed, is, " whether I think it necessary to introduce the scythe or the hoof previous to the first ploughing, or whether-I do not think it practicable to obtain equally good crops, from land where the whole mass of vegetable matter

has been turned under"

In answer to the first part of this enquiry, I will observe that it is not necessary to use the scythe, or to pasture the land previous to ploughing, provided impediments to good ploughing do not exist in the soil, such as stones, stumps, &c. and the mass of grass or other vegetable matter tion, by reason of the colde frostes, that overtooke article to market was three years, from its being is not too rank for the plough to subvert or compacked in India till it arrived in cloth at the mer-inletely turn under. If it can be effectually buried pletely turn under. If it can be effectually buried by the plough, the more vegetable matter is ploughed in the better for the succeeding crop, and the more fertilizing to the soil. But when this plan is adopted, it is necessary to sow the wheat or rye upon a single ploughing, and har-row in the seed. The former system pursued throughout Pennsylvania and this Valley, is generally exploded. Instead of breaking the fal-lows early in the spring, stirring them once or twice during mid summer, and again in the fall

^{* 7} Geo. I. Stat. i. cap. 7. † Monthly Magazine.

ter plan is adopted, of suffering the field to lie and using rakes. This is an expeditious part of corn was hoed three times, all the suckers wer ture, or to be ploughed in, intoto, where the land was poor and required such aid. But in this case care is taken not to disturb the sod or vegetable the whole mass is reduced to a fine powder, remass deposited beneath the furrow. The plough-sembling scotch snuff. ing is done in August or September, and after lying two, three or four weeks, to meliorate by exposure to the influence of rain and air, the crumble into powder, by handling it roughly, six the car; one basket of which was shelled, and The harrows to be large and weighty, with strong, sharp iron teeth. Those I use are 41 horses, in two days. Tobacco, in this case, affect square, with 24 teeth, 12 inches long, 11 inches square, and projecting below six inches.—

The produce would have been 119 bushels and 26-32 of a bushel of shelled corn—on the 14th of Nov. the whole was shelled, fords an excellent hygrometer to ascertain the inches square, and projecting below six inches.—

To a single harrowing does not reduce the surproper state of the air for this operation. To prevent the dust, which rises during the tread which was 58 to 59 lbs. the bushel—the entire expectation in the same force of hands and been 119 bushels and 26-32 of a bushel of shelled corn—on the 14th of Nov. the whole was shelled, and measured, and found to be 116 bushels and 28-32 of clear sound corn; the average weight of prevent the dust, which rises during the tread. face to a good tilth, it may be harrowed again, ing, becoming both offensive and injurious, it is pense of cultivating this acre of corn, including and the second harrowing may cross the first, if proper to keep open the barn doors, and permit it is found not to disturb the sod. The mass of a free passage of air. Shovels must be kept em

Committee on Agricultural Experi- fall; this process will not only crush in the small ments, submit for the consideration of the Board, ones, but even the surface for the scythe, without the following, in addition to their report dated the least injury to the grass roots-to this digression I am impelled by no other motive, however That Col. Joseph Valentine, of Hopkinton, is much I may be mistaken, than the wish of advanraised the greatest quantity of Potatoes, being 547 bushels, on one acre. "The land was twice ploughed, and furrowed three feet apart, and the greatest quantity of and had been down to grass 6 or 7 years—in 1821 of approach, had outlit two years since been negmanure, unfermented, made by sheep, and neat cut about one ton of hay; it was then ploughed lected, was also exhibited. These communicately, its quantity about 14 cords, placed in hills as deep as the sward would turn over; 10 cords two feet apart, hands immediately following the cart with hoes to finish the planting process, to post was marsh mud, spread and well harrowed; pers, together with three very interesting comprevent the loss by evaporation—planting finished it was ploughed in ridges three feet apart; about munications from William Hull, Esq. of Newton, May 21- the kind of seed used was the South A- one pound of seed was sown with a machine on on the best mode of raising Indian Corn, his merican reds, 28 bushels to the acre, cut so as to the ridges; and a hard roller made to pass over mode of cultivating seven-eighths of an acre, from allow two pieces to the hill—the weeding finished them, which completed the sowing—when out of which he procured 192 bushels of Corn in the ear, the 15th of June—the second and last hoeing the the way of the fly, they were thinned to the disfirst of July, the vines beginning to bud, and were tance of one foot apart on the ridge—they were about eight inches in height; a few scattering twice ploughed and harrowed; and harvested the weeds were occasionally pulled up, but no other last of October—the entire expense of cultivating January next. disturbance was given to the vines till harvesting this acre of Turnips, including 20 dollars for mathe crop, which was finished November the 3d; nure, was 35 dollars and 82 cents." and by a careful measurement was found to be 547 bushels-the expense of cultivating the acre of to the Society's premium of Twenty dollars, for one acre of land, to wit: Mr. Asa Rice, Jr. of

the greatest quantity of Mangel Wurtzel, being common cart loads of compost manure, such as Fitchburg, 116 bushels and 12 quarts; and Mr. about three cords of compost manure, and producted about 530 bushels. May 9th, 1822, ploughed, ving spread on about the same quantity and quality and quality clining to gravel, descending to the North East harrowed and furrowed three feet apart; four and a half cords of compost manure were put in the furrows and covered with a plough; then a harmiddling crop; the other part of the acre productive furrows and covered with a plough; then a harmiddling crop; the other part of the acre productive furrows and covered with a plough; then a harmiddling crop; the other part of the acre productive furrows and covered with a plough; then a harmiddling crop; the other part of the acre productive furrows and covered with a plough; then a harmiddling crop; the other part of the acre productive furrows and covered with a plough; then a harmiddling crop; the other part of the acre productive furrows and covered with a plough; then a harmiddling crop; the other part of the acre productive furrows and covered with a plough. the land, the seed was then sowed one row on each ridge, with four pounds of seed—half the quantity would, I think, be sufficient—June 10th, cart loads, of 40 bushels each—the quality of this commenced ploughing between the rows, and manure was similar to that above described, but Barley was about six inches high, it was mowed 16th—the plants stood 10 or 12 inches apart in the when mixed with our dark clay loam, with a clay periment. July 18, mowed the six rowed Barley, rows—the work was done principally by boys, estimating two boys to be equal to one man. Oct. 3, spread on one half the ground, and after harrowing, into the barn, the two rowed Barley. The six

That, Mr. Adams Knight, of Newbury, is entirows 14 inches apart, which took between 3 and 4 lars and seventy five cents."

pounds of seed—in the course of the season it was hoed between the rows, and weeded four times—in September the onions were harvested, and there were 651 bushels—the entire expense of cultivating this acre of onions, including 21 entitled to the premium of Twenty dollars, for raising the greatest quantity of vegeta-

bushels—the expense of cultivating the acre of to the Society's premium of I wenty dollars, for one acre of land, to wit: Mr. Asa Rice, Jr. of wheat, including \$10 charged for the manure, was \$24,71—that of cultivating the acre of Potatoes, including \$14 for manure, \$54."

That Mr. David Little, of Newbury, is entitled to the society's premium of \$20, for having raised \$15 bushels on one acre. "In the year Daniel Mears, of Lynn, $87\frac{1}{2}$ bushels; Messrs. 1821, something less than a quarter part of the Tristand and Henry Little, of Newbury, 116 acre was cultivated with Turnips, and about five bushels and 9 quarts; Payson Williams, Esq. of 970 bushels, and one half of a bushel, on one acre. salt marsh pulverized, strong earth and sand was Daniel Burnham, of Newburyport, 117 bushels "The situation of said acre is as follows—swell laid thereon; the produce was 80 bushels, the and 8 quarts, Mr. Jacob Wilkins, of Marblehead, inclining south-westerly, of a rich yellow loam—other three fourths had been laying to grass five raised 57 bushels of Barley, on one acre and an in 1821, it was planted with beets, manured with or six years; and the present year we sowed Flax eighth of an acre. "April 12, 1822, the land was row was drawn lengthwise the ridge to smooth ced about 700 weight of hay, which was cut on the the piece-at the same time sowed one and a half weeding, and thinning at different times till July more sand in order to make the compost better, down, and left on the ground; this was for ex-Nov. 1st and 2d, they were harvested by men and was put into small ridges, with a small double rowed Barley appeared to be about 12 days for-boys, and produced 970 bushels of Mangel Wurt mould board plough, two feet and nine inches ward of the two rowed in ripening—both were zel, besides 2 bushels of Carrots, and 109 Cabba- apart; the other part of the manure was shovel- stacked separately in the barn; and each quality ges-three loads of the Mangel Wurtzel contain- led into furrows made with the plough, the same thrashed and kept separate. August 30th, the ing 137 bushels, were weighed at the town scales, distance; the plough then passed between the fur-barley being cleansed, was measured—the six the weight according to the certificate annexed, rows, covered the manure, and although so great rowed measured 34 bushels; and the two rowed was 3 tons, 2 c. 2 qs. 20 lbs. Six swine were mostly a portion of the manure was spread on half the measured 23 bushels—the straw we consider in land, yet the other half produced about as much—value to be equal to the labour." No premium ing, until about the first of October—there are the quantity of seed used was one pound and a was offered for raising the greatest quantity of trees on the said lot sufficient to produce 21 bar-half; the time of sowing was from the 1st to the Barley; but your Committee are induced to rerels of fruit-the entire expense of cultivating 10th of July-the flax was pulled the 4th, and that commend that the Treasurer be authorised to pay this acre of Mangel Wurtzel, including the cost part of the ground sowed the last; the whole was said Jacob Wilkins, the sum of Twenty dolof the manure and gathering the crop, was \$23 sown with a machine made for the purpose, and lars. but one row on a ridge—when the turnips were up, and out of the way of flies, they were thinned Beets, Parsnips, Ruta Baga, Cabbages, and dry tled to the Society's premium of twenty dollars, with a hand hoe and fingers, at the distance of 10 Peas-for introducing any Grass not before cultifor having raised the greatest quantity of Onions, being six hundred and fifty-one bushels, on one acre. "The soil is a rich gravelly loam, with a ploughed, with the small plough above mentioned actual experiment, and producing satisfactory evidence onions, and cabbages; and was manured with onions, and the cabbages are cabbaged with onions. about five cords of barn manure, and produced a and about 5 or 6 bushels of large defective rotten and through the whole season, together with a good crop—after the crop was off the ground, ones—we have weighed several bushels, and find particular account of the food given, and how culture were five cords of barn manure, and two a bushel will weigh 59 pounds—the entire ex-tivated—for making the experiment of turning in and a half cords of leached ashes ploughed in—in pense of cultivating this acre of turnips, including green crops as a manure, on a tract not less April 1822, it was once ploughed, and sowed in thirteen dollars for manure, was twenty eight dol-than one acre, and proving its utility and cheapness,

well." The committee are of opinion that the dollars and 37 cents, the cost of the manure, was proving by experiments, to the satisfaction of the roller should be used immediately after the seed 57 dollars and 38 cents."

Claims for premiums were also exhibited to your Committee by the following persons, for That, Silas Little, Esq. of Newbury, is entitled raising the greatest quantity of Indian Corn, on

pense of raising the same, and the best mode of horse of America. preserving the same through the winter-for taking up in one season, on his farm, the greatest acre. No claims for premiums have been exhibited.

The Board will perceive by the papers accompanying this report, that of the seven claimants for the premium for raising the greatest quantity of Indian Corn on one acre, the quantity produced by four of the competitors was very nearly the same. Your committee in awarding the premium to Col. Valentine, were induced to decide in his favour as well from the quantity of sound corn, as from the weight of the grain; it will be seen that Mr. Burnham's Council Bluff Corn, weighed only fifty pounds; that of Col. Valen-tine, fifty eight to fifty nine pounds the bushel.

For the Committee, THOMAS L. WINTHROP, Chairman

Boston, Dec. 28th, 1822.

TO THE BREEDERS OF THE VIRGINIA RACE-HORSE.

all the United States to your Stock. Eclipse mares. Indeed, I am informed in some instances, himself is a descendant of the Virginia horse; where the profits are excessive, and the horse's and you have stocked the Carolinas, Georgia, power is quite unequal to the service required Kentucky and Tennessee, with that spirited, for mares of the first character, that the owngenerous and noble animal, the race-horse. It therefore behoves you, from a consideration of reputation of your stock, crowd upon him many profit as well as a matter of pride, to devote a common plough mares, whose progeny is destingreater attention to the breeding and rearing of ed for hack and drudges. In cases like these, your horses than you have lately bestowed-to are you not destined to meet with failure or reap return to the particularity of your ancestors, disappointment? And to say the least of it, is it whose attention, zeal and judgment produced so valuable a race of animals. The horse, whether considered alone as ministering to our comforts might correct such errors by withholding your and convenience in agriculture and the pursuits support, or changing its direction, and thereby of pleasure, is highly important, and as yielding teach the avaricious where their interest lies, profit and affording security in time of war, be- and the necessity of moderation in their desires comes doubly more so. The Arabians possess the best war horse, which is known by exportation, in every fine horse, and the owner should never and they derive from them annually a considerable revenue. The nimble saddle horse, the generous hunter, the majestic coach horse, and the proud and spirited charger, are all the produce of the blooded horse; and we know from experience, that they are the most lasting and durable for the plough. How important then does it become for you to renew your attention hints here thrown out, and exercising the judgand redouble your exertions to preserve and ment which I know you possess, you will restore propagate a race of animals so very valuable.— Of all the United States, Virginia has hitherto possessed the finest horses. The liberal exertions of many of her citizens in the costly importation of the Arabian horse, and the best blood stock of England, the judicious crossing of these, aided by her climate and her soil, so congenial to their propagation, have given to her a race, for activity and durability, for speed and bottom, that will vie with all the world.

The value of the race horse is daily becoming

judgment in your efforts of breeding, I would not tion and blood of your stallions—the necessity of a remote cross—a caution against the carelessness and villany of grooms in affording, or promoting opportunities of stolen enjoyments-and lastly,

and most important of all, I would guard you against the impropriety of overstrained exertions, and urge the necessity of consulting the opinions of celebrated naturalists and breeders.— The great Buffon, and many others assure us that the progeny of animals overstrained in their upon which stood five large apple trees, that de sexual intercourse, dwindle and degenerate: that foals from stallions serving too many mares, deteriorate from the perfection of their parentsthat the chances of conception greatly decrease from an excess of mares; and that disappointment is too often the fate of those who disregard these facts. In England, the most experienced breeders assert, and it is the generally prevailing practice there, that no stallion should them down, which was not the case with solitary Stimulated by a love for every thing which perform duty to more than 40 or 50 mares in a stocks—these branched out sooner and bore more gives importance to my native state, and having season—however, I believe that a horse while beans. If any farmer wishes to try the crop, boserved the disrepute and neglect into which young and full of vigour, with careful manage—would advise him, if his land is good, to put two you have suffered your blooded stock of horses ment, may serve somewhat more; but after he beans in a hill, and pull one plant up when the to fall, I am induced to offer you a few ramarks has advanced in years, price and reputation, his have grown four or five inches high. The plant on that subject. You have long possessed a race number should be limited. It often happens that should be four feet one way and four and on of fine horses, and the great match lately run at the owner of a fine horse, too greedy for profit, half feet the other—these he should work as he exceeds the power of the horse in the number of does his corn. so far forget it as to think, alone of his individual profit; he should be made to feel the propriety of preserving the value and reputation of your stock, by consulting the character of the mares, and exercise the justice which is due to his benefactors, by a limitation of their numbers

In suggesting the exercise of more zeal and adgment in your efforts of breeding, I would not pounds of the Virginia herb, to be tried by any quantity of good Honey, and shall at the same recommend the particularity prevailing in Pertime, exhibit superior skill in the management sia and Arabia, of collecting persons to witness of Bees—for giving proof of having produced the largest quantity of dressed Flax raised on one and horses, and the birth of the foals; but I Daniel Annin, of Opiquon, Frederick County, would recommend the preservation of, and a who was with me, and took a little home for strict regard to pedigree-a care to the perfectrial. He observes, under date of Nov. 1822, " I " feel authorised to say, by a small trial, in one "case, of your Senna, that it is no doubt, a spe-"cies of that plant, and may be used as a sub-"stitute for the imported Senna, with advan-tage." If physicians in your vicinity would try it, they may call at Mr. Butler's, and take some for that purpose.

I raised sixty bushels of PALMA CHRISTI, or Castor Oil Beans, on two and one half acres of land, stroyed ten hills square each—there was also a row of cherry and peach trees, on two sides of the ground, that injured the outside rows all their

length.

I found one stock in a hill was better than more, bearing more beans, and not growing so high. Where there were more stalks, we could not get the bunches of beans without breaking

I am, with respect, your's, ABEL SEYMOUR.

J. S. SKINNER, Esq.

FOR THE AMERICAN FARMER.
PROPOSAL TO FORM A PERMANEN FUND FOR THE MARYLAND AGRICUI TURAL SOCIETY.

90

MR. SKINNER,

The Cattle Shows and Fairs, which are he in Maryland, are novel exhibitions here, and e cite much attention. Many persons attended view the display of valuable stock, who are n directly interested, not having any to exhib But the far greater number seek informatic and estimate properly the advantages which will result to the community, from the exertio of those praise-worthy, practical farmers, a others, who are improving our breeds of stoc

The Agricultural Society of Maryland, is y in its infancy; the members are not ve numerous, and as all the funds are deriv from a small annual contribution from ea member, the amount is too limited to enable t society to offer pecuniary rewards, sufficient induce those who would prefer compensation that way, to make efforts to be noticed in t

distribution.

To gentlemen of wealth, the pecuniary tuity is not an object; they esteem more high the honour of excelling, and it is honoura to excel in any laudable pursuit. But a f mer, who has to scuffle hard to get alo finds all his time and funds employed, in c rying on his business in the old way, and not risk a few extra dollars, if he has them spare, or employ a part of his time, in mak experiments, unless he can make a reason; better known; from Virginia they are sought, I will plant when the season arrives. I send you calculation for profitable returns. And farm

will carry off the prizes, until those fine ani determine the case as will be most proper.

mals become more numerous.

But although the funds of the society are very limited, I think it would be profitable to share the premiums between stock and crops. If a farmer has not got stock to vie with the Teeswater, and Devons, and Dishleys, he must have managed his business very badly, if he has not a few acres of rich land; and although he may have nothing to compare with Champion, or Bergami, or Mr. Barney's Bakewell's five inches fat on the ribs, he might shew, that he can raise as much corn, wheat, potatoes, turnips, &c. &c., per acre in Maryland, as can be done elsewhere. For instance, I would refer to Mr Bennett's and Gen. Ringgold's crops of corn. Mr. Bennett's seldom exceeded on one acre. Gen. Ringgold's, equal to any other crop on a large scale.

But I think the improvement of land, is of primary importance, and instead of giving so decided a preference for the improvement of live stock, some of which require, compared with our usual mode of treatment, very extraordinary keep; there ought to be simultaneous endeavours to effect both objects. Where grass has not been cultivated in sufficient quantity, roots can be substituted, until the grasses become more abundant; and if the society could offer liberal premiums for crops and livestock, it would persuade many to deviate from the common practice; for if farmers can be congrasses, and enlarging the manure heap.

I wish a plan could be devised to raise a nerality of farmers to risk some money, time ponds in that vicinity. and labour, to increase their crops, and rear fine animals. And among other premiums, not ne-cessary to detail, to offer liberally for the best and most profitably cultivated farm in each county, having reference to the mode and expense of cultivation, the produce and improvement. For collecting and applying the largest COMPLETE SETS OF "THE AMERICAN quantity of stable and cow-yard manure; reference being had to circumstances, size of farm, number of stock, means of accumulation, quali

the earth.

157. Never sow when the ground is wet; nor,

then, care must be taken to sow early enough in the fall for the plants will lie safe great advantage to almost all plants to move the frost pener in this way all the winter, though the frost pener in this way all the winter, though the frost pener in the distance of three feet beneath them, but, how is this to be done, unless they stand in rows; and, as to the pints, so as to let the bar up and down, as octation may require; and, of course, while the roller is turning, at the end, the bar, with the great advantage to almost all plants to move the teeth in it, is raised from the ground.

164. Thus are the drills made by an ox, in trate to the distance of three feet beneath them, but, how is this to be done, unless they stand in about five minutes, which would perhaps require about the minutes, which would perhaps require. except the seeds of such plants as a slight frost will rows? If they be dispersed promiscuously over a man more than a day to make with a hoe. In cut down. The seed of kidney beans, for instance, will rot, if the ground be not warm impossible.

will do twelve acres in a day with ease. And to enough to bring it up. So will the seed of cumbers, melons, and Indian Corn, unless buried method so obviously advantageous, is, the trouble. eight men at the least; for, there is the line method so obviously advantageous, is, the trouble. beyond the reach of the influence of the atmosphere. Even early peas would be best sown in the fall, could you have an insurance against mice. carrots, lettuces, beds of cabbages, and other were lettuces, beds of cabbages, and other beans cannot, and especially kidney beans. Drills we liknow, what a bustle there is toget in early forms. If they were sown in the fall, they would consider the saving of trouble afterwards, this is a large scale, how tedious and expensive must start up the moment, the frost were out of the trouble is really nothing even if the drills were be the operation to make the drills, by line and start up the moment the frost were out of the ground, and would be ten days earlier in bearing in spite of every effort made by the spring-sowers to make their peas overtake them. Upon a spot, where I saved peas for seed, last year, some that was left, in a lock of haulm, at the harvesting, and that lay upon the dry ground, till the land was ploughed late in November, came up, in the

the seed be actually *pressed* by the earth in every then may be killed by the frost. One object of the left hand tooth of the Drillerin the right hand part; and many seeds, if not all, are best situated this fall-sowing, is, to get the work done ready for drill that has just been made; so that now I make when the earth is trodden down upon them.

156. Of course the ground should be good, either in itself or made good by manure of some either in itself or made good by manure of some the instant the frost breaks up; for the ground is was before made by the right hand tooth. Thus, the instant the frost breaks up; for the ground is sort, and, on the subject of manure, see Para-sort, and, on the subject of manure, see Para-wet and clammy, unfit to be dug or touched or graphs 28 and 29. But, in all cases, the ground trodden upon. So that here are ten days lost. way a pretty long bed is formed into nice, straight should be fresh; that is to say, it should be dug But, the seed, which has lain in the ground all the drills in a very few minutes. The sowing, after just before the act of sowing, in order that the winter, is ready to start the moment the earth is this, is done with truth, and the depth of the coseeds may have the full benefit of the fermen-seeds may have the full benefit of the fermen-clear of the winter frost, and it is up by the time vering must be alike for all the seeds. If it be tation, that takes place upon every moving of you can get other seed into the ground in a good Parsnips or Carrots, which require a wider disspring is not practised in England, though they which, as they are to stand only for a while, do indeed, if it can be avoided, perform any other act with, or on, the ground of a garden. If you dig ground in wet weather, you make a sort of mortar of it: it binds when the sun or wind dries it. The fermentation does not take place: and it becomes unfavourable to vegetation, especially if the ground be, in the smallest degree, stiff in if the ground be, in the smallest degree, stiff in the strong of the ground be, in the smallest degree, stiff in the strong of the ground be, in the smallest degree, stiff in the strong of the ground begins with severity and ends with mildness. So that the tools might descend from father and too toome for some days after ground has been up and the plants would be destroyed before moved; for, if the wet come before the ground be destroyed before to son, to the fourth or fifth generation. I hope, the day at top, the earth will run together, and eat small plants up in the wind outsness, object to the drilling of seeds in a garden.

The second of the ground as the strong of the ground as the groun will become bound at top. Sow, therefore, if ter. Other insects and reptiles do the like. From possible, in dry weather, but in freshly-moved these obstacles the American gardener is free. ter. Other insects and reptiles do the like. From these obstacles the American gardener is free. His winter sets in; and the earth is safely closed be ploughed, furrows might make the paths, the ground.

158. The season for sowing will, of course, find a place under the names of the respective ing of the North of Virginia, to be sure; but the driller might be used for onions, or for any thing of the North of Virginia, to be sure; but the driller might be used for onions, or for any thing else. However, what I have done for Kidney

THE AMERICAN GARDENER.

Spring, the moment the frost was out of the ground, in the head. This head is made of White Oak, and they were in bloom full fifteen days earlier than those, sown in the same field as early as possible in the spring. Doubtless, they would have borne peas fifteen days sconer; but there were some and an inch in diameter at the head, and is pointed to borne peas fifteen days sconer; but there were a little at the end that meets the ground. This state. Fall-sowing of seeds to come up in the tance between the rows; or, Cabbage plants, spring is not practised in England, though they which, as they are to stand only for a while, do

plants; and, I do hope, that it is, when I am gardener to the south will adapt the observations addressing myself to Americans, unnecessary to his climate, as far as they relate to it.

160. As to the act of sowing, the distances and or a horse. The roller is about eight inches in the forther might be used for onlines, or for any thing gardener to the south will adapt the observations to his climate, as far as they relate to it.

160. As to the act of sowing, the distances and or a horse. The roller is about eight inches in the forther might be used for onlines, or for any thing gardener to the south will adapt the observations to his climate, as far as they relate to it. for me to say, that sowing according to the Moon 160. As to the act of sowing, the distances and or a horse. The roller is about eight inches in is wholly absurd and ridiculous, and that it arose depths differ with different plants, and these will, diameter, and ten feet long. To that part of the solely out of the circumstance, that our forefa-of course be pointed out under the names of those thers, who could not read, had neither Almanack nor Calendar to guide them, and who counted by seeds; and that is, that they should be sown in two fieces of wood and two fins, a bar ten feet seeds; and that is, that they should be sown in two pieces of wood and two pins, a bar ten feet Moons and Festivals instead of by Months and rows or drills; for, unless they be sown in this long. Into this bar I put ten teeth; and near the Days of Months.

Way, all is uncertainty. The distribution of the middle of the bar two handles. The roller being Days of Months.

159. However, it is necessary to observe, that some, and even many, things, which are usually sown in the Spring, would be better sown in the fall; and especially when we consider how it the fall; and especially when we consider how it the fall; and especially when we consider how it the fall; and especially when we consider how it the fall; and especially the consider how it the time there is for doing all things in the spring. Parsnips, carrots, beets, onions, and many other things, may be safely sown in the fall. The seed will not perish, if covered by the earth. But, then, care must be taken to sow early enough

and the shafts and frame of White-Oak, which even without paint, will last a life time.

straight, my ground was ploughed into lands, one that the ox had only to be kept straight along dry. upon the middle of the land. And, in order to have the lands flat, not arched at all, the ground ground is not wet; but, here again, as in the case was ploughed twice in this shape, which brought of sowing, let it be dug, or deeply moved, and the middle of the lands where the furrows were well broken, immediately before you transplant the middle of the lands where the furrows were well broken, immediately before you transplant before, as in the foregoing parts of this before. If, however, the ground had been flat into it. There is a fermentation that takes place Chapter, I propose to speak only of what is of ploughed, without any furrow, there would have immediately after moving, and a dew arises, been no difficulty. I should have started on a which did not arise before. These greatly exceed, straight side, or on the straightest side, leaving in power of causing the plant to strike, any thing cultivation under the names of the several plants. out any crook or angle that there might have to be obtained by rain on the plants at the time of out any crook or angle that there might have to be obtained by rain on the plants at the time of been. I should have taken two distant objects, planting in wet earth. Cabbages or planting, having been properly performed, the found, or placed, beyond the end of the and Ruta Raga (or Swedish Turnip) I have prowork, and should have directed the head of ved, in innumerable instances, will, if planted the ox in a line with those two objects. Before I in freshly-moved earth, under a burning sun, be started, I should have measured off the width to a great deal finer than those planted in wet find where the ox ought to come to again, and ground, or during rain. The causes are explain- from each other; because, if left too close, they then have fixed two objects to direct his coming ed in the foregoing paragraph; and, there never

the piece had been finished upon which the corn was to be planted? And in all the books on husbandry and on gardening where it rains, or drips, sometimes, for a month have Inot, at other times, seen the farmer making that I have ever read, English or French, this together, it is impossible to prevent weeds from these marks, one at a time, with a plough? And transplanting in showery weather is recommended. have I not seen the beauty of these most beautiful scenes of vegetation marred by the crookedness of the plants will be scorched; but the lines thus drawn? Now, take my roller, take all the teeth out but three, let these three be the set four feet apart. Begin mell on one side of the hours, and new leaves in a few days. Then it is at four feet apart. Begin well on one side of the hours, and new leaves in a few days. Then it is 24 inches in as many hours; in this climate, scanfield; mount your horse; load the teeth well with that you see fine vegetation come on. If you dalous indeed it is to see the garden, or the field, a stone tied on each; drop the bar; take two plant in wet, that wet must be followed by dry; infested with weeds.

abjects in your eye; go on, keep the two objects the earth, from being moved in wet, contracts the late. But, besides the act of killing weeds, before and the inside tooth. You have already of Cabbages, Ruta Baga, Lettuces, or, almost any thing but keep down the weeds. The hoeing measured at the other end (where you started,) thing, I would find the ground perfectly dry at and have placed two objects for your guide. Go top; I would have it dug deeply; plant immediately and, in general, with a hoe that has spanes on, keeping these objects in a line; and you have ately; and have no rain for three or four days, instead of a mere flat plate. In short, a sort of on, keeping these objects in a line; and you have ately; and have no rain for a month to rain at the arong in the posture of a hoe. And the spane three more lines. Thus you proceed till the field! I would prefer no rain for a month to rain at the arong in the posture of a hoe. And the spane of this prong hoe may be longer, or shorter, of this prong-hoe may be longer, or shorter,

to garden-sowing.

ground, and, in all cases, tread it with your feet, burnt up and totally destroyed, stems and all, in which has been digged between, will, when the ground, and, in all cases, tread it with your jeet, burnt up and totally destroyed, stells and the property moist. Then rake it stightly a hot sun, in a few hours. Cucumbers and Melons, crop is ripe, weigh nearly, if not quite twice as again; for all seeds grow best when the earth is for instance, and some plants of flowers. These, much as the other half. But, why need this be pressed closely about them. When the plants which lie in a small compass, must be shaded at said in an Indian Corn country, where it is so

TRANSPLANTING.

for sowing. If you do this work in wet weather, the earth very closely about the stem of the plant find new food, and send, instantly, fresh vigour to or, when the ground is wet, the work cannot be is of little use, if you leave the point of the root the plant. The effect of this tillage is quite well done. It is no matter what the plant is, loose. I beg that this may be borne in mind; for surprising. We are hardly aware of its power in whether it be a cucummer plant, or an oak-tree, the growth, and even the life, of the plant depend producing vegetation; and we are still less aware the growth, and even the plant depend producing vegetation; and we are still less aware the growth, and even the life, of the plant depend producing vegetation; and we are still less aware the growth, and even the life, of the plant depend producing vegetation; and we are still less aware the growth, and even the life, of the plant depend producing vegetation; and we are still less aware the growth, and even the life, of the plant depend producing vegetation; and we are still less aware the growth, and even the life, of the plant depend producing vegetation; and we are still less aware the growth, and even the life, of the plant depend producing vegetation; and we are hardly aware of its power in mind; for surprising. were it for nothing but the look, ought not the log.

How many crops are lost by the waiting for a peep-hoeing is enough in some cases; but, in others discount is necessary to produce a fine and garden-sowing.

168. When the seeds are properly, and at 173. However, there are some very tender the other half of the piece have nothing but a

was led to think of the drilling of crops in the fields of England, from having, when in France, observed the effects of inter-tillage on the vines, in the vineyards. If he had visited America instead of France, he would have seen the effects of that tillage, in a still more striking light, on plants, in your Indian Corn fields; for, he would have seen these plants spindling, yellow, actually perishing, to-day, for want of ploughing; and, in four days after a good, deep, clean and careful ploughing, especially in hot weather, he would have seen them wholly change their colour, become of a bright and beautiful green, bending their leaves over the intervals, and growing at the rate of four inches in the twenty-four hours.

"length of the piece 20 yards; the figures in the middle of it are 20 Turnips, sown early "and well hoed The manner of this hoeing " must be, at first, near the plants, with a spade, "and each time afterwards, a foot distance, till "the earth be once well dug; and, if weeds "appear where it has been so dug, hoe them out " shallow with the hand-hoe. But, dig all the "piece next the out-lings deep every time, that it may be the finer for the roots to enter, when "they are permitted to come thither. If the "Turnips be all bigger, as they stand nearer to "the end B, it is a proof they all extend to the "outside of the piece, and the Turnip 20, will "appear to draw nourishment from six foot dis-" tance from its centre. But if the Turnips 16, "17, 18, 19, 20, acquire no greater bulk than the "Turnih 15, it will be clear, that their roots " extend no farther than those of the Turnip 15 "does; which is but about 4 foot. By this method "the distance of the extent of roots of any plant, "may be discovered .- There is also another way "to find the length of roots, by making a long " narrow trench, at the distance you expect they " will extend to, and fill it with salt; if the plant "be killed by the salt, it is certain that some of " the roots enter it.

"What put me upon trying this me-"thod was an observation of two lands, or "ridges (See Plate II. Fig. 2.) drilled with "Turnips in rows, a foot asunder, and very a even in them; the ground, at both ends and one " side, was hard and unploughed. The Turnips " not being hoed were very poor, small, and yellow, except the three outside rows, b c d "which stood next to the land (or Ridge) E,

"The end A. 2 feet, the end B. 12 feet, the | "gave a dark flourishing colour to these three " E, received so much benefit from it, as to grow must have it given them by hand. "twice as big as any of the more distant rows. "from the land E as from the land A, wherein yard, to give each Turnip as much increase as " all the roots had done in their own land. Except ever saw in England. "that it will hereafter appear, that the new 189. Before I entirely quitted the subject of nourishmenttaken at the extremities of the roots Cultivation, there would be a few remarks to be " a bulk quadruple to the row d." 186. Thus, then, it is clear, that tillage amongst Fruits.

183. The passage, to which I have alluded, is make it of the best quality; but, it prepares the of so interesting a nature, and relates to a matter ground for another crop. If a summer fallow be of so much importance, that I shall insert it entire, good for the land, here is a summer fallow; if and also the flates made use of by MR. Tull to the ploughing between Indian Corn frequences the and other crops will, of course prepare the land

187. Watering plants, though so strongly re-commended in English Gardening Books; and so much in practice, is a thing of very doubtful 184. "A Method how to find the distance to utility in any case, and, in most cases, of posi"which roots extended horizontally. A piece, or plot dug and made fine, in whole hard ground, suffering from long drought; but, even if all the gardens and all the fields could, in such a case, be watered with a watering pot, I much question, whether it would be beneficial even to the crops of the dry season itself. It is not, observe, rain water that you can, one time out of a thousand, water with. And, to nourish plants, the water must be prepared in clouds and mists and dews. Observe this. Besides, when rain comes, the earth is *prepared* for it by that state of the air, which precedes rain, and which makes all things damp and slackens and loosens the earth, and disposes the roots and leaves for the reception of the rain. To pour water, therefore, upon plants, or upon the ground where they are growing, or where seeds are sown, is never of much use, and is generally mischievous; for, the air is dry; the sun comes immediately and bakes the ground, and vegetation is checked, rather than advanced, by the operation. The best protector against frequent drought is frequent digding, or, in the fields, ploughing, and always deep. Hence will arise a fermentation and dews. The ground will have moisture in it, in spite of all drought, which the hard, unmoved ground will not. But always dig or plough in dry weather, and, the drier the weather, the deeper you ought to go, and the finer you ought to break the earth. When plants are covered by lights, or are in a "rows; and the Turnips in the row d, which house, or are covered with cloths in the night time, "stood farthest off from the new ploughed land they may need watering, and in such cases,

188. I shall conclude this Chapter with ob-"The row c being a foot nearer to the new serving on what I deem a vulgar error, and an "ploughed land, became twice as large as those error, too, which sometimes produces inconve-"in d, but the row b, which was next to the land nience. It is believed, and stated, that the ground "E, grew much larger yet. F is a piece of hard grows tired, in time, of the same sort of plant; " whole ground, of about two perch in length, and and that, if it be, year after year, cropped with " about two or three foot broad, lying betwixt the same sort of plant, the produce will be small, "those two lands, which had not been ploughed and the quality inferior to what it was at first. "that year; it was remarkable that, during the Mr. Tull has most satisfactorily proved, both by "length of this interjacent hard ground, the rows fact and argument, that this is not true. And I "b c d were as small and yellow as any in the will add this fact, that Mr. Missing, a Barrister, "land. The Turnips in the row d, about three living in the Parish of Tichfield, in Hampshire, "foot distant from the land E, receiving a double in England, and who was a most excellent and "increase, proves they had as much nourishment kind neighbour of mine, has a border under a south wall, on which he and his father before him "they stood, which nourishment was brought have grown early heas, every year, for more than "by less than half the number of roots of each of forty years; and, if, at any time, they had been "these Turnips. In their own land they must finer than they were every one year of the four or " have extended a yard all round, else they could five years that I saw them, they must have been "not have reached the land E, wherein it is something very extraordinary; for, inthose years "probable these few roots went more than another (the last four or five of the more than forty) they were as fine, and as full bearing, as any that I

"in the land E, might enable the plants to send made upon the means of preventing the depreda-"out more new roots in their own land, and tions of vermin, some of which make their attacks " receive something more from thence. The row on the seed, others on the roots, others on the "c being twice as big as the row d, must be stem, others on the leaves and blossoms, and " supposed to extend twice as far; and the row others on the fruit; but, as I shall have to be "b, four times as far, in proportion as it was of very particular on this subject in speaking of "a bulk quadruple to the row d."

PAPERS COMMUNICATED FOR PUBLICATION IN THE AMERICAN FARMER, BY ORDER OF THE UNITED AGRICULTURAL SOCIETIES OF VIRGINIA.

No. 4.

REPORT ON AGRICULTURAL PREMIUMS. (Submitted to the Delegation, and approved December 6th, 1822.)

The committee instructed by the delegation "to inquire into the subject of premiums for the " improvement of Agriculture, the advantages " and disadvantages which have been found to "attend them, and the course which may be

not their only means for promoting the im-provement and extension of agricultural science. We venture to dissent from this received opinion, and though fully impressed with the benefits which might be derived from premiums judipractice is productive of but little good, and perhaps of more evil than good, to the objects which they were intended to promote.

to use good utensils, and to keep his live-stock in good condition. Yet want of capital, care, or industry, causes many of them to continue in the opposite courses—to use insufficient or ex-hausting tillage, bad utensils and half starved nel. teams. But as much as improvement in this respect is wanting, none could be produced by premiums. Profit is the farmer's great object, and if that itself does not improve his practice, nothing else can. If the reasonable expectation of doubling his crops, has no effect in inducing him to adopt a better system, it is idle to expect any tish Board of Agriculture is as liable to the societies conferring them; for nothing could be more absurd than proposing premiums for practices, which they themselves knew to be unprofitable. Premiums may produce fine acres of wheat in Massachusetts, or of clover in Lower Virginia, and yet leave the profit or loss as uncertain as before. such exertion from the offer of a 20 dollar pre-

which, so far from being profitable, would insure a loss to every one who gained or contended for them. Such are the premiums for the most productive acre of corn, wheat, rye, potatoes, &c. the finest (i. e. the fattest) ox, cow, sheep, hog, red their gold medal on some person, who had &c. To obtain these premiums, enormous crops have been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness, which shave been brought to a degree of fatness. no consideration of market price, or nett profit would ever have induced, or will ever cause others to imitate. It is doubtful whether in Chi-least profitable crop.

of plants, and to speak of the proper treatment to raise every acre to the maximum of producthe best apology which can be made for them, for each, under the three heads, Vegetables and duction. In the United States, where land is so is, that their influence is extremely limited. cheap and labour so high, the least reflection That they cannot even indirectly produce the will shew such a course to be folly in the ex-treme. The certain effects of these wonderful by experience. Within the space of two years, improvements in agriculture, prevent the exam-in New York, \$20,000 was furnished from the ple being followed, and fortunately, the loss is State Treasury, in addition to the contributions confined to the few who make a single effort of their numerous Agricultural Societies, and merely to obtain a premium. He who succeeds devoted to premiums. No where have they best in a losing business, has not thereby benefitted himself or his neighbours; and universal ertions for success. Had the plan really tended ruin would ensue, could the Societies extend the to extend agricultural knowledge, we might have acre and all the fattened stock in the country.

The Agricultural Societies of the northern states ly seen published, a circular letter from the stand foremost, both in activity and success in dis-Board of Agriculture, which draws together all tributing premiums of this kind; and we are more the correspondence of the societies, requesting particularly called on to notice them, because their from private individuals, such communications as "deemed expedient for the Delegation to pursue, for the purpose of fulfilling that part of
"their duties as enjoined by the constitution"—
"the constitution of the cons Report as follows:—

It has been almost universally the plan of Agricultural Societies, to devote a large proportion of their funds to premiums for such practices as they considered improvements in agriculture.—

From the general concurrence in this column. These facts in the constant of the constant of the compose these societies; we doubt not their ability to have supplied the deficiency, which the circular letter admits to exist. We see too much of this deplorable inertness in our own purpose, published in the 2nd. vol. of the American Farmer. In our own justification, therethey considered improvements in agriculture.—
From the general concurrence in this course, it must be inferred, that such societies consider the premiums which they offer, as their best, if less of the great objects of our association.

these premiums, we admire and fully estimate their knowledge of agriculture, nor in any way the zeal which prompted them in our sister so-promoted its interest or improvement. cieties of the north. We also readilyac knowledge Though our opinions would tend greatly to liciously bestowed, we feel satisfied that the usual that their Cattle Shows and Fairs were attended mit the range of premiums, there still remain with collateral benefits, well worthy the atten-enough objects, for which they would be highly tion of other Societies. By thus instituting an-useful. All these will be found in what we nual agricultural festivals, the societies were have called the third class, i. e. practices, of Premiums can only be offered for practices of three kinds, viz:—1st. Those which are known to be profitable—2d. Those which are known to be profitable—2d. Those which are known to be unprofitable—and 3d. Practices of which the support of the zealous and sedate but premiums are as often thrown away on this profits are doubtful or uncertain. It is so evident as to require no proof, that premiums of activity and zeal were suddenly excited, which case, whenever a premium is given for obtaining the first kind must always be useless. As general propositions, every farmer knows that it is most producing a few fat beeves and rich acres, withprofitable to enrich his fields, to till them well, of agriculture. When the utter uselessness of degree of profit, or loss, attending those new such premiums is seen, as it soon must be, we crops. Many of the premiums usually given are fear that the zeal which they excited will subside, instead of being turned into a proper chanbe considered as such, according to the opinions

to adopt a better system, it is idle to expect any tish Board of Agriculture is as liable to the Accurate experiments on any doubtful points are charge as any association of inferior celebrity, as always valuable to agriculturists in general, but in may be seen in the account of their last distri- far the greater number of cases, cause loss to The greater number of premiums offered are bution of premiums. (See pages 147, 8, and 9, their conductor. Hence the peculiar propriety of the second class, and are as clearly hurtful as 3d vol. of the American Farmer.) Nine bulls of the preceding are useless. A reference to the list of premiums offered by societies, will shew that much the greater number of cases, cause loss to bution of premiums. (See pages 147, 8, and 9, their conductor. Hence the peculiar propriety of encouraging experiments by premiums. An agricultural experimenter may, possibly, by some that much the greater number of premiums offered by societies, will shew that much the greater number are for practices, ing 2465 lbs. which was admitted to be "too fat previous lossors; but such good fortune is rare, which so far from being profitable would insure the greater number of cases, cause loss to bution of premiums. An agricultural experiments by premiums. An agricultural experiments may possibly, by some fortunated to be "too fat previous lossors; but such good fortune is rare, which so far from being profitable would insure the greater number of cases, cause loss to bution of premiums. to serve" in his vocation, or we presume for any and most persons, who in this way have renother purpose, unless for the tallow chandler and dered signal services to farmers, have done so

way to actual experiment, in every branch of said for every score of premiums heretofore beknowledge to which it was applicable, except stowed.

Remedy.—Take half a pound of good Scotch agriculture, the most important of all; and it is the feelings of partisans, and whether they sup-port an antiquated prejudice, or the wildest [Exti modern hypothesis, are equally sure that they re right. As examples of the chance for success in this method of searching for truth, in England, the merits of Tull's Drill system is scarcecountry and in Europe, without appearing to found in the heads of sheep but also in the deer makes it more certain to prove effectual.

approach a decision, and in this district we are as much divided in comparing the advantages of grazing and inclosing, natural and artificial, injury to the sheep of our country, than all the different seasons of the year, and making expe-

able, even if such premiums had merely the effect of giving publicity to the numerous experiments which are made with other views, and which would otherwise never be known.—
But we can scarcely doubt that their number to greatly increased, be directed to the most important objects, and conducted with far more care and attention, when, in addition to the hope of being honoured with a premium, the experimenter would expect to profit by the laburs of many others, engaged in similar respectives.

We consider the time and labour, the unremitting attention and perfect accuracy required, the sacrifice is evidently too great to expect from any of the nostrils and the wind pipe, from 25 to 100 small white grubs, with black heads and a black streak on the back, and in June a black streak on the back, and burs of many others, engaged in similar researches.

Agriculture remains in the same situation in which formerly all sciences were, that required experiment for their proper investigation. From the time of Aristotle to that of Lord Bacon, philosophy made scarcely any progress. During this long period, every philosopher who reached celebrity, distinguished himself by producing some baseless hypothesis, which was received as true until overthrown by one more plausible, but which was alike destined to yield in its turn. The profound Bacon first pointed out the eddings of many points in husbandry, that the representation is with the same situation in a to be scarcely satisfactory to their conductor, as to be scarcely satisfactory to their conductor, towards spring, at which time they may be discovered, by sickly countenance and loss of flesh, notwithstanding all the grain and roots that can be given them; sometimes running at the nose, (though not always,) and snorting as if trying to blow something from the head. In some instances they will suddenly spring about in a wild frantic manner, and drop down dead. When other way, draw more honour on themselves, or not it most into the most important subjects for experiments, require attention to every thing which can affect results, and unite the labours of many, for the attainment of a single object. The members of the society which shall commence this course, can in no other persons. Societies by notwithstanding all the grain and roots that can object the most important subjects for experiments, require attention to every thing which can affect results, and unite the labours of many, for the attainment of a single object. The members of the society which statistically approached the proposed that the proposed the proposed that the proposed that the proposed the proposed that the proposed that the proposed the proposed that the The profound Bacon first pointed out the tedious, norant on so many points in husbandry, that the so poor that their wool stops growing, becomes but sure road to escape from this labyrinth of only difficulty would be in selecting subjects for loose and much of it falls before shearing, many error, and Newton by pursuing that course, and experiments. However little might be done by of the lambs are lost, and those that live are stinttesting every proposition by experiment, was a single society, yet every premium conferred ed by reason of the ewes being poor and sickly, enabled to go farther than all his predecessors. Since then, the old mode of theorising has given ledge. We doubt whether as much could be times the sheep will linger along, pining away

therefore not surprising that agriculture has re- cultural Societies of Virginia, that a committee be it and let it stand till cold, inject about a table mained almost stationary, while other sciences have advanced with such rapidity, as scarcely to allow the world to mark their progress. Agriculturists alone continue to grope through theories, unfounded opinions and prejudices. Some erally to the opinions supported in the foregoing the grubs are then small and are much easier deone proposes a new theory or system of cultiva-tion—every speculative farmer immediately be-comes its advocate or opponent—volumes may be

DISEASES OF SHEEP.

important consequences. To prove by experigreen and dry grass for improving the soil, and
ment that a doubtful practice is wrong, would
be as valuable to agriculture, as if the result
should shew that it is right: but on many such
points, proof has perhaps been obtained fifty
different times, by as many farmers having no
communication with each other, and still the
results may be unknown to all but the several
chance discoveries, made at long intervals, and
supports for experiments, conseparated by errors and absurdities innumerable.

Resolved by the Delegation of the United Agri- snuff, pour two quarts of boiling water on it, stir written for and against, and perhaps a century that much benefit may be derived from the conspent before it is decided whether the opinion was tinuation of this course, right or wrong. Such is the course we regularly pursue; and as in every contested point, one party must be wrong, and in consequence, pursue and unprofitable practice, the loss of money, labour on the ploughman who shall gain the premium, recover. I never knew any bad effects to follow.

sheep, there are many cavities, and a little above each nostril there is a thin substance wound up into four folds, the grubs get into these cavities and folds, where it is not common to reach them the first operation, but by repeating it three or four times, at proper intervals, they will crawl out and be all destroyed. The reason of my diland, the merits of Tull's Drill system is scarcely yet settled, and the war between the Fallowists and the Anti-Fallowists, will probably conyears since worms have been discovered to breed
tinue another thirty years. The advocates for in the heads of sheep, though it is probable they
rotted and unrotted manure, still contend in this

If the above directions are strictly attended to with all the sheep of our country, more than a I am a half enthusiast in these matters myself, sheep, by many degrees. Merinos were then million of dollars would be saved in the United and you cannot oblige me more, than in giving unknown. As to their prolific capacities, no States yearly; as all sheep (in this part of the me any information respecting new inventions doubt can be entertained, provided the right kind world at least) are infected with these vermin; if any person doubts it, let them examine sheep from the 20th of September to the first of June.

I have found that our sheep are semetimes

shining, water constantly running from them, and a gradual loss of flesh, they generally decline till the latter part of the winter and then die .-I lost a Buck last winter with the above symptoms, and on dissecting, I found every part natural except the lights, which were nearly all ulcerated.

Remedy .- Tar, or tar water is good, but after the disorder is fully seated, it is doubtful whether

any thing will be of service.

Foot rot .- This disorder is occasioned by sheep going in wet pastures. There is an issue in the division of each hoof, a little above the hoof, some have erroneously supposed it to be a living worm. When the sheep stand long in water, it affects the issue of their feet, so that an inflammation takes place, and if they are not removed to a dry pasture the feet will rot off. Perhaps it would be better for those, whose land is low to take out those issues, which may be easily done, by putting the finger the under side of the foot and pressing upward, then with a sharp pen-knife cut through the skin around the mouth of the issue, and with a strong pair of tweesers it may be pulled out, the place will then heal and the sheep will not be liable to the rot in the foot, though they should run in wet pastures. But when the pastures are dry, which on the whole, is best for sheep, I think it not proper to pull out the issue; for this reason, the God of nature has bidding defects, especially the former, may tend have succeeded by changing the male, or the made them thus, and undoubtedly for the benefit to discourage our farmers in their endeavours to female, as the case required. This I have pracof the sheep, as much as the issue in the legs of obtain and multiply this valuable race. Mr. tised with cattle, as well as sheep.

Jefferson's account of his sheep, would corrobotate the idea that your sheep were not singular. I have been, at several periods of my life, a breeder of sheep and cattle, and have had as I should be sorry, indeed, that such opinions fine animals as most I now see. The English should prevail generally; although I cannot en-breeds were then not so highly improved, as the generative and all other faculties of this race of Europe and Germany. Save that the Alderney of the Laticaude, from my experience of and race were always in high estimation. I had personal attention to them, for a period of four-teen years. I never had, or heard of, a similar failure in any of the sheep, whereof I have given milkers, even from the best parentage; though In my early life, I had a fine flock of English and chiefly devoted to large dairies, during more than "Dear Sir,—I have received the three vols. of the American Farmer" and Mr. Eastman's ver since seen. I spared no care not expense in Cylinder Straw Cutter; I find much information relation to them; and was then well acquainted away, and I can now only enjoy recollections; the old beaten track of their forefathers; and no respect is this more evident than in every thing connected with Agriculture. I verily believe that the plough now in use amongst the natives, has received no improvement since the time of discovery; it is the same described in the third volume of the Farmer, as the one used into the qualities of the Tunis Sheep, and took possession of our city and its environs, I had no respect is this more evident than in every the superiority of the wool. Many of my sheep the superiority of the wool. Many of my sheep the superiority of the wool. Many of my sheep the superiority of the wool. Many of my sheep the superiority of the wool in the superiority of the wool. That next the plant had a number of high blooded young Colts, which I failed in having driven off from one of my farms. Ten or eleven of them were shot down by the Hessian or Yager Banditti, for their skins. This two and some three cuts in the length of the was a damper to my equestrian propensities.—

When I returned to my domicil, I found my

I have, now, none of this breed I can recommend.

Your pair may not be prolific, yet may be of a good kind, except as to the wool. How many pair of comely and promising Bipeds do we see, without progeny? Were we to generalize such instances, we should tremble under the apprehension that the human race would cease to "in-Matthus' alarms would then be nugatory indeed.

In my account of the Tunis sheep, vol. 2d. page 221, I relate the difficulty of a Tup of the common kind, coupling with a Tunis Ewe. But no such difficulty is experienced either with a common ewe, or with a female Laticaudæ. Nature is too wisely directed, to permit any impediments to their intercourse. I would not be understood to say, that the Tunis fleece is comparable to that of really fine wooled sheep. But its abundance, its not being deciduous, and its applicability to all common uses, for which fine wool is unfit, far overbalance its inferiority in this

tertain any doubts of the facts you state, I must they are now esteemed to be. We procured our confidently repeat my former assertions, as to breeders chiefly from Holland, the low countries an account in our second volume of Memoirs .- often I have had success. My farms have been

horses, and the barbarian and merely mischievcollection of fine, young and thriving fruit trees, mortified me more than the more important deprivations. Added to weightier excitements to dowed mother in the farm house. He sarcastically told her, that "Washington had been a low mechanic."—She replied that she had never The house was burned in a night or two after.

But, as a mark of good breeding, I will close my prosing letter, which I began only to rescue my best regards.

Your's, very truly, RICHARD PETERS.

TH. JEFFERSON.

MAJOR J. ALDUM.

George Town, D. C. July 1st, 1822.

DEAR SIR,

In one of Mr. Jefferson's letters to me. vol., and be then in time to permit its re-publi- fox grape :- Mr. Bartram, who had the botanication long before the recurrence of our wine and cider making months.

Ed. Am. Farmer.

Ed. Am. Farmer. gardener to Governor Penn, before the revolution, and he thought it so superior to any of the native grapes, he was acquainted with, that he introduced it into Mr. Penn's garden, from whence it has made its way by the name of the English

In a letter from Wm. Penn, dated August 18th, 1683, to the Free Society of Traders residing in 1, page 249,) speaking of the natural produce of

the country, he says :"The great red grape (now ripe) called by have assumed its character, so that its quality resembling the red Burgundy of Chambertin ignorance, the fox grape, because of the relish it may then be determined. I have most of it subscribed for, by officers of the United States gowernment, and citizens of Washington or George-vernment, and citizens of made, the company could not distinguish the vet little inferior to the Frontiniac, as it is not one from the other. It hink it would be well to push much unlike it in taste, ruddiness set aside; in No. 32 of the American Farmer, is rather obscure, where it says, "so that the whole vintage was 65½ bushels." This was the produce which it will take centuries to adapt to our soil ther observes—"It seems most reasonable to more than double that quantity of grapes, which grew on, "in all," about an acre of ground.

Your's respectfully,

JOHN ADLUM.

The object of the present letter is so far to tresspass on your kindness, and your disposition to promote a culture so useful, as to request you at the proper season, to send me some cuttings. I intend if Cod gives a life to serves—It seems most reasonable to believe, that not only a thing groweth best, where it naturally grows, but will hardly be equalled by another species of the same kind, that doth not naturally grow there. But to solve the doubt, at the proper season, to send me some cuttings. at the proper season, to send me some cuttings I intend, if God gives me life, to try both, and of that vine—They should be taken off in Febru-hope the consequence will be, as good wine as

> I have given the above extract to do away, if possible, some of the prejudice that exists against the fox grape, having paid more attention to it, than I suppose any other person has. I have found several varieties of it very palatable, and prejudice aside, many of them may be used by the most delicate palate, with a degree of satisfaction—though I, at the same time admit, that a great majority of them are far from being agreeable to the taste.

Respectfully your's, JOHN ADLUM.

J. S. SKINNER, Esq.

dollar per gallon, and 350 gallons be obtainable there is never one atom of any thing whatever put tional Intelligencer, upon the manufacture of from the produce of one acre of land, would into any of the good wines made in France. I wine, &c.; the writer of which, observes, that name that country, because I can vouch the fact in his method, a bushel of grapes did not yield duction even amounted to five sevenths of its duction even amounted to five sevenths of its value?

the power and continuance of the pressure, or in the nature of the grapes, or to inaccuracy in the estimates, we shall be better enabled to decide, after Major Adlum shall have answerded the inquiries of J. C. B.; who appears to think "that his own process was very imperfect," made by an observing farmer of this county, after allowing one fourth for unoccupied space failed in his efforts to seed his ground with clothe grapes were of a good kind.

To the Editors of the National Intelligencer. GENTLEMEN: In the Intelligencer of 9th Nov. of your paper, the process which he pursues in about 12 hours; then press them, putting the juice into vessels, letting it remain until the juice emitted a white froth, then tighten the bung gently until tranquil. I added one pint of brandy to each gallon of the juice, &c.

December 5th, 1822.

GUINEA CORN AND GUINEA GRASS. Pine Forest, Dec. 26th, 1822.

I enclose a small piece of what is called in our state, a kind of Guinea Corn—the head I cut it from, is about 2 feet long; and was presented to me by Capt. J. Wharley, of Colleton district, in this state, who informed me that it was very productive, to cut as the Guinea Grass, to feed horses, or cattle. He had this year, more

than thirty stalks, from one seed.

Of the Guinea Grass seed, which I raised the last year, much did not vegetate; still I had some very fine, and, with many of my neighbours, have saved more seed this year, by shaking it off; and I hope it has arrived to a greater state of maturity. I must also observe, that the Jamaica seed failed, at least three parts out of four. The seed which I planted about the 10th of May, came up much better, than what I planted the first week in April. I will send you some by the next opportunity. The sample of Guinea Corn send, appears to be similar to the fig. numbered 1, in the 36th No. 4th Vol. of the American Farmer. With my sincere wishes for an increased circulation to the Farmer,

I am your ob't serv't. JOHN S. BELLINGER.

CLOVER-DOES IT NEED A SHELTER-ING CROP?

Bridgetown, Jan. 7th, 1823.

DEAR SIR. Have any of your readers sown clover seed by itself on ground well prepared? If they have,

as we should ourselves have inferred; because, which he relates to me as follows:-Having in the bushel, and half of the residue as the ver, for two or three successive years, with the measure of skins, seeds and pulp, three gal-lons would still remain that might be juice, if ground well prepared, and afterwards sowed it down with clover seed; when the rye came up, he found that he had missed one land when seeding the rye, as none grew on it. The clover came up well on all the ground, but sooner on the ground where there was no rye, where it also grew ranker and faster. During the latter last, is a letter from Mr. Adlum, to the Editor of part of the season there was a drought which the American Farmer, giving an account of his killed almost entirely all but this one land, which vineyard, and its product, &c. in which he says, "that a bushel of bunches yields about three gallons of juice." Mr. Adlum would confer an ob. ligation, by communicating, through the medium transactions of the Society for the promotion of Agriculture, Arts and Manufactures, in the state of how managed after being pressed—how fined, lates an instance, in which the clover seed was quantity of wine from the native grant and state of the s sown alone on poor loomy land, and came up, and the best, but it must be sown upon good ground. &c. In the years 1820 and 1821, I male a small the next year produced a good crop, leaving the law in the next season that the potato oats were culturally of wine from the native grape. My method I think a very imperfect one, not yielding a land much better afterwards. Now, I know it gallon of juice to the bushel of grapes. I have has been a very common complaint for some frequently been requested to give information years, that it was very difficult to get clover to but they improved the next year, and are now take and stand through the first summer. I ask the grapes, and let them remain in that state then, would it not more certainly succeed if sown alone, and allowed the first and sole nou-Baltimore by the standard bushel of 30 lbs. rishment of the manure, for its support during its most helpless and tender state of existence ?tato Oats weigh about 36 to 38 lbs. per heaped And, if so, will not the greater certainty of a bushel, as formerly sold. These we wish to have good clover crop compensate the farmer for the tried against our friend's common kind, under loss of the grain crop? I conceive that it is at least worthy of a fair and conclusive trial. Very respectfully your's

EPHRAIM BUCK.

JOHN S. SKINNER, ESQ.

THE FARMER.

BALTIMORE, FRIDAY, JANUARY 17, 1823.

VARIETIES OF CORN, OATS, &c. We are indebted to a Maryland Farmer for specimens of corn, produced from seed that we had sent to him; "among them, some gourd-seed corn, having more than thirty rows* on the ear, and some yellow flint corn that came to perfection, quite hard in less than nine weeks." This evidence of kind remembrance and willingness to experiment and report the results, encouraged us to ask our friend to place us under new and greater obligations to him, for the benefit of others. And that we may not "press unfit of others. And that we may not "press un-fairly upon the willing steed," nordraw important conclusions from the issue of a single experiment, we beg leave to submit our views, and present our wishes to every friend of agriculture, who can find time, opportunity and the means of making the designated, or similar experiments.

We wish them to cultivate approved varieties of in the following particulars:

The quantity in weight and measure of corn and cob, together and separately—the spirits obtainable from these collectively, and from the corn alone—the quantity of fodder—the practi-

. One had 38 rows.

bushel of bunches." Whether the difference what was the result compared to that sown with cability of making equally good under crops, such in these results was owing to a difference in winter or spring grain? Does the crop increase as peas, beans, cymblins, pumpkins, &c.—the

other crops, would be interesting and beneficial and until we proceed with accuracy, through such details, we will continue as much affoat as ever, and our opinions of the comparative value of different crops, or varieties and parts of these.

We had sent to our friend some Black, Sweedish Oats, that Mr. Christopher Hughes, Jr. presented to us; and the receipt of them was accompanied by the expression of a wish that they might succeed on his farm, although he had not found any, of many tried varieties, to yield better than the common kind of our country .-We shall have it in our power, and we have promised to send him two varieties, that have been carefully and satisfactorily cultivated, in this county—the potato and the tartary oats they are productive and heavy. The potato oats gives the best straw; its leaves are numerous, making an impenetrable shade-the tartary vields rather the most bushels of oats; the potato variety outweighs the other, it also meals The first season that the potato oats were culexclusively grown by some attentive farmers in this neighbourhood. Oats are now sold in

and keep them clear from weeds, to dig the paths up every fall,
and keep them clear from weeds in summer.—
The second method of seed. The plants (raised as
not wholly unnecessary; for, though it demands with plants, instead of seed. The plants (raised as
less trouble in America, then elsewhere it description of the
plant, or of its uses, is necessary.

The word, Vegetables, is not, as was The word, Vegetables, is not, as was not wholly unnecessary; for, though it demands with plants, instead of seed. The plants (table a shore stated) may be planted in the beds at one his Chapter treats of the things cultimands some; and, in proportion as it is valuable as and esteemed, it is desirable that the means of at the same depth that is pointed out for depositvated in the garden to be eaten at our tables as and esteemed, it is desirable that the means of at the same depth that is pointed out for depositfood; and, they are Vegetables; but, a tree is procuring it should be well and generally underalso a vegetable; and such is a herb or a flower. Seed when it is deed rife. Sow it thinks in drills time of heaving the same depth that is pointed out for depositing the same depth that is pointed out for depth that is po Therefore, as a distinctive appellation, the word, seed, when it is dead ripe. Sow it thinly in drills time of beginning to cut, some say the third year, some two is trictly proper. But it is the word we use to distinguish this class of the promuck, or litter, a foot deep, and lay some boards, not before.—All that has here been said proceeds or poles, to prevent its blowing off. As soon as upon the supposition that the soil has a dry botthe frost breaks up in the spring, take off the litter. If a wet bottom, sow, or plant, at the top Pennyroyal, others are used, not only in medicine and in soups, but also eaten in salads. Therefore, it appeared to be best to bring into this one alphabetical list, all plants usually grown in a garden, except such as come under the heads of Fruits and Flowers.

192. ARTICHOKE.—A plant little cultivated in America, but very well worthy of cultivated in America, but very well worthy of cultivated in America, but very well worthy of cultivated in Its look it very much resembles a thistle of the big-blossomed kind. It sends up a seed stalk and it blows exactly like the thistle. thistle of the big-blossomed kind. It sends up a seed stalk, and it blows, exactly like the thistle that we see in the Arms of Scotland. It is, indeed, a thistle upon a gigantic scale. The parts that are eaten are, the lower end of the thick leaves that envelope the seed, and the bottom out of which those leaves immediately grow. The whole of the head, before the bloom begins to appear, do not remain a second, making the beds, and re-tere they reach that, the plants, the all others, moving the plants into them. It is desirable to cease to flourish, and begin to decay.—As to the have the beds about four feet wide, that you may time that asparagus beds will last, that depends on the soil. Having a dry bottom and good mathem, and not trample the beds. As to the first tions, and if that be not enough to compensate the manner described in Paragraph 20; but, in this trouble of making them, it would be difficult to find case, where there is a root always penetrating of Asparagus-beds is negligence; and particularly of the head, before the bloom begins to appear, is boiled, the pod leaves are pulled off by the eater, one or two at a time, and dipped in butter, with a little pepper and salt, the mealy part is stripped off by the teeth, and the rest of the leaf stripped off by the teeth stripped off by the teeth, and the rest of the decay downward, do not content yourself with a clean of Asparagus-beds is, negligence; and, particularly the downward, do not content yourself with a clean of Asparagus-beds is, negligence; and particularly the stripped off by the teeth stripped off by the teeth stripp stripped off by the teeth, and the rest of the leaf put aside, as we do the stem of asparagus. The bottom, when all the leaves are thus disposed of, is eaten with knife and fork. The french, who make salads of almost every garden vegetable, and of not a few of the plants of the field, eat the artichoke in salad. They gather the heads, when not much bigger round than a dollar, and eat the the beds into the paths, which will then form high be suffered to grow amongst it on the surface. It is a good as dipping them first in oil, vinegar, salt and pepper; and, in this way, they are very good. Artichokes are propagated from seed, or, from offsets. If by the former, sow the seed in rows a foot a part, as soon as the frost is out of the ground. Thin the plants to a foot apart in the row; and, in the ground; but, let the haulm be quite dead the first; yet, do it before the frost actually sets in. Though a some little care is an except to good as a shes, except the beds are very near the sea; in spring, thin them to a foot apart. Thus you will and there it is of little use.—With regard to have them a foot apart all over the bed. Keep the plants clean all summer; and, when the haulm is except such as climate produces. It is very certain, that, to whatever cause owing, the Asparation of the year, put out the plants in clumps of first; yet, do it before the frost actually sets in. fall of the year, put out the plants in clumps of four, in rows, three feet apart, and the rows six feet asunder. They will produce their fruit the next year. When winter approaches, earth the roots well up; and, before the frost sets in, cover all well over with litter from the yard or stable. Open at the breaking up of the frost; dig all the of the bed, with a fork. Upon this manure, throw the white turnih; here it has a leaf like that of the bed, with a fork. Upon this manure, throw the white turnih; here it has a leaf the colour of the bed, out of the paths, three inches that of an early York cabbage; that is to say, of ones, or offsets, growing out from the sides. Pull these off, and, if you want a new plantation, put them out, as you did the original plants. They will be not then the plants that of any or though later than the old case that on a specific put them out, as you did the original plants. They again fork up, put on ashes or good mould, and for I will carry some cold to I will carry some carry to I will carry some cold to I will carry some carry to I will the winter operation of littering; and, in the spring again fork up, put on ashes or good mould, and the space which the beds ought to occupy, that may be the other three inches deep of earth out of the paths. Thus you bring the beds to be an inch or two higher than the paths; and this year, if a least the Asparagus. Plenty, however, is always and the other, rather conical. As to the quantity your work have all been well done, you may have be sufficient.—For Jerusalem Artichoke, see Jerusalem.

The paths; and this year, if your work have all been well done, you may have be sufficient.—For Jerusalem Artichoke, see Jerusalem.

The paths; and this year, if your work have all been well done, you may have a blessing when the commodity is a good one. About six beds across one of the Plats will be succeeding fall, cut down the haulm and cover with litter as before; and, in the spring, of this the greatest facility. There are but few things asto which end of the Asparagus the eaterought come out of the paths dug six inches deep. This

well down upon the seed; and as soon as the soil and treatment. Asparagus, like other things, frost sets in, but not before, cover the ground with ought to be used when it comes in perfection, and

will be enough for a family

cribed, the rows a foot asunder, and the plants that the latter are grown with poles, which the green before the 2d of October when the first four inches apart in the row. Keep them clean, former are not. In this fine country the seed is frost came. They were not cut up by the frost and manure them the first year. Cut the haulm off so good, the soil and climate so favourable to the till the 17th of October; and they kept bearing in the fall. Do not cover them during winter. In plant, the use of the vegetable so general, the till they were .- A row or two sown every fortthe spring fork up the ground, manure it again; propagation and cultivation so easy, and so well and, in the fall cut off the haulm again. Just before the frost sets in, take up as many plants as you will want for your hot-bed. Dig each plant up without tearing it about; and put them all object to have them early, and they may be had up without tearing it about; and put them all object to have them early, and you will be more than sufficient. It is carefully on a cellar floor, cover them over about much earlier than they usually are with a little best to sow several sorts of these; for some bear half a foot thick with fresh ground, and lay some pains. It is useless to sow them while the ground early and some later than others .- As to the sorts straw upon that to prevent the earth from drying is cold; for they will not grow till it be warm; but, of Kidney-beans, they are, as I observed before, too much. In January prepare dung for a hot-there are means to be used to get them forwarder almost endless in number. I will, however, name bed; and make the bed in the manner as directed than the natural ground will produce them. If you a few: the Dun, or Drab coloured dwarf bean is in Paragraphs 69 to 74. When the heat has sufficiently risen, put on earth as in Paragraphs 75 Paragraph 94,) use one or the other in this case; ripen two crops in one year, the last from the and 76. Upon this earth put your plants, straightening out their roots in every direction, Let the together, a couple of wheel-barrows full of good Speckled; the Painted; white and red: these crowns of the roots be about 7 inches apart all lot dung; and lay some good rich mould upon are all dwarfs; but there are a great many others, over the bed, which, being a bed four feet wide it six inches thick. Then lay on this some of the and nine feet long, will contain 180 plants. Cover carliest sort of dwarf-beans. Put them not more the plants over with fine earth, so that the surther and cover them with two black and the seed-pod rough. There is a White face of this earth be six inches above the crowns inches of fine rich mould. Bend some rods over bean precisely like the former, except that the of the plants. Proceed as to air, shelter, and control the whole, and put the ends of the rods in the bean and blossom are white. The Case-knife vering in the same way as directed for the cabbage-plants. In about twelve, or fourteen days, you roof over with a bit of old carpet or sail-cloth. runner; this is the best bean of all to eat green. may begin to cet asparagus for the table; and, In default of these, corn-stalks may do. Do this if you take proper care, and keep your heat up by when the winter frost is just got out of the ground, lours as to seed. The Lima-bean, which is never a lining (see Paragaph 93,) you may have a or soon after. The beans will be up in a week's caten green (that is, the hod is never eaten,) and regular supply for a month. When the plants time; and, in about a fortnight afterwards, they which is sometimes called the butter-bean, has a have done bearing here, they are of no use, and will be fit to remove. The place for them is broad, flat and thin seed of a yellowish-white inay be thrown away. Of all the things that are under a wall, a pailing, or a hedge, facing the colour. This bean must never be sown till the forced in hot-beds, none give so little trouble as South. Prepare the ground well and make it ground is right warm. The other sorts will grow Asparagus, and none is so well worth a great rich. Take a spade and carry away a part of and bear well in England; but this sort will not. the beans at a time, and plant them at six inches I raised good and ripe Indian Corn at Botley; 194. BALM is a herb purely medicinal. A asunder with as much earth about the roots as but, I never could bring a Lima-bean, to pervery little of it is sufficient in a garden, it is pro- you can. Plant them a little deeper than they fection, though I put it in the hottest spot I could pagated from seed, or from offsets. When once stood in the bed. They are very juicy, and may find, and though cucumbers produced very well planted, the only care required is to see that it have a little water given them as soon as planted, in the natural ground at a yard or two from it. Shade them the first day, if the weather be warm For the raising of dwarf beans on a large scale. 195. BASIL is a very sweet annual pot-herb, and the sun out; and cover them every night till see paragraphs 163 and 164. The pole beans may There are two sorts, the dwarf and the tall. It should be sown in very fine earth, and, if convenient, under a hand-glass. The bunches may be dried for winter use.

196. BEAN.—The only species of bean much used in this country, is, that, which, in England, plant in clumps, and flower-pots put over the social and the sun out; and cover then every night till see paragraphs 163 and 164. The pole beans may be raised in the same way, only with larger spaces any sort of fence, by putting boards, one edge (six feet perhaps) between the rows, and without upon the ground and the other leaning against the fence; but, if you have no fence, and have in this way even it. England, where the climate to plant in the open ground, it will be best to it so cold and wet compared to this. The poling is a great plague and expense; and if large is called Kidney-Bean, and in France, Haricot. The clod or two, or a brick or two, laid by the side of nay it may be dispensed with in a garden; for Bean I here mean is, what is called by most per-Bean I here mean is, what is called by most persons in America the horse-bean. In England shell, which is an excellent covering. On the and the addition they make to the crop is not there are some sorts of this bean used for horses first of June, 1817, I saw a farmer at South a compensation even for ill look, especially under and hogs; but there are several sorts used as Hampstead, covering his beans with burr-dock this bright sun, where the ground is almost conhuman food. It is, at best, a coarse and not very leaves, while there were hundreds of horse-foot stantly dry.—Let it be observed, that every sort wholesome vegetable; yet some people like it. It shells in his yard. The dock-leaf would wither of Kidney-bean must have rich ground to produce is very much eaten by the country people of in the day. A fresh supply must be had for the a large crop.

England, with their bacon, along with which it next night. This circumstance shows, however, 198. BEET.—This vegetable, which is little is boiled. There are several sorts of these how desirous people are to get this vegetable used in England, is here in as common use as garden-beans, the best of which is the large early; and, by the method that I have pointed carrots are there. It should be sown in the fall flat-seeded bean, called the *Uindsor-Bean*. The out, it may be had fifteen days, at least, earlier (see Paragraph 159;) but, if not, as soon as the Long Pod is the next best; and though there than it generally is.—As to the main crop, it is ground is free from frost, and is dry, in the spring, are several others, these are enough to mention by no means advisable to sow very early. If you here.—The bean is difficult to raise here. It do, the seed lies long in the ground, which is always injurious to this plant. The plants come up in the spring (if sown then) soak it four days moist and stiff land. If attempted to be raised up feebly. The cold weather, that occasionally and nights in rain water before you sow it. Put in America, it should be sown in the fall by all comes, makes them look yellow; and they, then, it two inches deep, cover it well, and press the means (see Paragraph 159;) but, still it is useless never produce a fine crop.—Of the various sorts earth hard down upon it. Sow the seed pretty to sow, unless, you guard against mice. If sown of pole beans one sowing is enough; for, if you thick all along the drill; and, when the plants in the South Border, where it would be shaded gather as the beans become fit for use, they con- come up, thin them to eight inches apart. Hoe and protected from the hot sun, it might do pretty tinue bearing all through the summer, especially well; and the vegetable is convenient, as it follows the Lima-bean, which delights in heat, and for because these tap rooted things are apt to fork immediately after the early peas are gone.—Ten which no weather can be too dry; and which if the ground be made loose very low down while rows of these beans across the South Border, should never be sown till the ground be right they are growing.—There are yellow and white four feet apart, and the beans four inches apart, warm. The Dwarf sorts may be sown all sum- Beets, as well as red; but the red is the true ill be enough for a family.

mer, from the time that the ground becomes kind: the others are degenerate. There is, howmer, from the time that the ground becomes kind: the others are degenerate. There is, howmer, from the time that the ever, round, or turnip-rooted, red beet, which is variety of sorts. Some are dwarfs, some climbers; little frosts begin in the fall; for, they will, at equally good with the tap-rooted-beet.—The but, the mode of propagating and cultivating is this season, produce, for eating green, in six weeks ground should be rich, but not fresh dunged nearly the same in all, except that the dwarfs from the day of sowing. I sowed them on the Ashes of wood, or compost mould, is best; and require smaller distances than the climbers, and 15th of August, and had several gatherings to eat the digging ought to be very deep and all the

Then there is the Cranberry-bean of various co-

between the plants frequently; but not very deep;

clods ought to be broken into fine earth; because one half the county is arable, or cleared land, and | Gloomy, however, as is this view of the tillage the clods turn the point of the root aside, and the remainder woodland, tide marsh, swamp &c. make the tap short, or forked. Fresh Dung, very little of which is worth bringing under cullight arising from the spirit of enquiry now genewhich, of course, lies in unequal qualities in tivation.* the ground, invites the tap root, or some of the side roots to it, and thus causes a short or forked by wheat, when the land is equal to the productive, within a few years, manifest evibeet, which, for several reasons, is not so good tion of 4 or 5 bushels per acre, and the field then dences of improvement; and we therefore, in as a long and smooth one.—As to the preserving grazed until the fourth year, when its turn comes of beets during the winter, it is well known, that the way is to put them in a dry cellar, with dry the usual course. Those who pursue it, seek to which have in an essential degree tended to obany thing at all between them. They may, it in the adjoining forest, and thus increase the size of quiry, propositions are advanced which appear large quantities, and not wanted till spring, be their fields, or supply the place of what is utterpreserved out of doors, thus: Take them up three weeks before the hard frost is to come. Cut off their leaves; let them lay two or three days upon straw, or boards, to dry in the sun; as to leave very little for improvement. Under the straw upon the ground and in such management it is according to the size of quiry, propositions are advanced which appear either trite or paradoxical, we hope at least, that they will not be denounced, until investigation decides them to be useless or false.

In the adjoining forest, and thus increase the size of quiry, propositions are advanced which appear either trite or paradoxical, we hope at least, that they will not be denounced, until investigation decides them to be useless or false.

So the size of quiry, propositions are advanced which appear either trite or paradoxical, we hope at least, that they will not be denounced, until investigation decides them to be useless or false.

So the size of quiry, propositions are advanced which appear either trite or paradoxical, we hope at least, that they will not be denounced, until investigation decides them to be useless or false.

So the size of quiry, propositions are advanced which appear either trite or paradoxical, we hope at least, that they will not be denounced, until investigation decides them to be useless or false.

So the size of quiry, propositions and either trite or paradoxical, we hope at least, that they will not be denounced, until investigation decides them to be useless or false.

So the size of quiry, propositions are advanced which appear to the size of quiry, propositions are advanced which appear to the size of quiry, propositions are advanced which appear to the size of quiry, propositions are advanced which appear to the size of quiry, propositions are advanced wh then lay a little straw upon the ground, and, in such management, it is scarcely necessary to add a fine dry day, place ten bushels of beets (picking out all the cut or bruised ones) upon it in a conical form. Put a little straw smoothly over the heap; then over the whole with six or eight heap; then cover the whole with six or eight lear there are still more, who practice even a rience proves that it has been either totally disinches of earth; and place a green turf at the worse mode, by denying to their fields that small regarded, or is at best, but slightly operative. Nor do we conceive that we shall materially erg, and the point, before the frost set in. All the whole heap will freeze during the winter; then or fifteen years, has been every luconsiderable; but, the frost will not injure the beets, nor will it and though the effort is now general to increase of this subject, on the part of agriculturists of every description—whether practical or theoretical proposes are approved as another grain; that crop must still be year limited. more than two perches of ground) will produce

REPORT ON THE STATE OF AGRICUL TURE IN PRINCE GEORGE, VIRG.

No. 5.

hideous caricature.

sand between them, or indeed, without sand or prevent a diminution of their crops, by clearing struct its advance. If in the course of this enanything at all between them. They may, if in the adjoining forest, and thus increase the size of quiry, propositions are advanced which appear

injure Carrots, preserved in the same way.—It its production, (on account of the low price of you have more than ten bushels, make another heap, or other heaps; for fear of heating before the frost comes. When that comes, all is safe till spring; and, it is in the spring, that season of scarcity, for which we ought to provide. How ediand.—If the first effect of this change, is in-which of scarcity, for which we ought to provide. How ediand.—If the first effect of this change, is in-which of scarcity and the spring; and there are flung about and creased attention to making manura, it also discordant as are the opinions of agriculturists, they may properly be classed under the two heads of hractical and theoretical, which names, though not exactly appropriate, with names, though not exactly appropriate, with names of distinction. With many bushels of beets are flung about and creased attention to making manure, it also di-wasted in the fall, the smallest of which would rects its whole application to a crop, which gives our practical men, he is the best farmer who cul-

they are of the size that they ought to be, here are much more than enough. Beets may be transplanted, and will, in that way, get to a good size. See Transplanting, Paragraph 169.

(To be Continued.)

be scarcely worth bringing into cultivation, the assertion is intended to apply to the only course which many acres does he cultivate?"—"What amount of crop does he make?"—By such estimates, is the unconnected efforts of different individuals, who are compelled always to begin the work at the wrong end—on the outskirts and head branches.

Yet the gross product is very different from wrong end—on the outskirts and head branches. 812 beets, or nearly four for each day, from the first of November to the last of May; and, if be scarcely worth bringing into cultivation, the asinstead of at the outlet and through the middle of sists,) and the former may be, and frequently is, the swamp. Therefore all attempts have been atnever had more than partial success.—But if our culating the probable cost and profit of every Legislature would PERMIT extensive swamps process of cultivation and improvement, and in At a meeting of the Agricultural Society of to be drained on a rational plan, the improvement consequence, would reject whatever was not more Prince George, held on the 9th March 1821, the would be one of the most valuable and decidedly profitable than costly, a most extensive and benefollowing Report of the Committee, appointed at the cheapest which could be effected in lower Virficial change would be immediately produced. It the request of the Delegation for that purpose, ginia. Blackwater Swamp and its numerous may perhaps be useful to state a few examples of was read, unanimously adopted, and ordered to be branches contain thousands of acres of the richest laid before the next meeting of Delegates.

P. H. THWEATT, Sec'ry.

The committee appointed by the Society, to this county. A central drain ten feet wide would land, including every attendant operation, exenquire into the state of agriculture in the county effectually reclaim all this land, and herhalis at pense and injury, cannot be rated lower than \$5 of Prince George, and to suggest the remedies the same time afford good sluice navigation durper acre. The highest price of corn at this time, which they may think calculated to correct the ing part of the winter. But however well assuries \$2 per barrel,* and of course 21 barrels per which they may think calculated to correct the ing part of the winter. But however well assurexisting defects, regret to state, that the want of ed its owners may be of the value, and cheapness existing defects, regret to state, that the want of ed its owners may be of the value, and cheaples means for obtaining correct information will, of of this operation, it never can be effected by princeessity, prevent as ample an investigation of the value agreement among so many persons. If only this report was made. The low price above statted caused a diminution of grain culture, and an merits.—They believe, however, that the report or is a minor and of course unable to consent, all increase of that of Tobacco and Cotton in this increase of the country, and as far as the same reasons operated, country, and as far as the same reasons operated, the rest can do nothing—A law ought to be pass accurate, is at least free from those prejudices ed to grant to those owners disposed to attempt wherever climate and situation did not forbid the which would prompt either a flattering picture or this work, power to proceed at their own risk, and change. This, together with two successive bad only in case of their succeeding, compet all others seasons for corn, has nearly doubted its price. hideous caricature.

The soil of this county is generally level, light and poor, though a considerable proportion differs in one or all of these characters. Rich land, fers in one or all of these characters. Rich land, along the rivers and swamps which intersect the county. All the good soils have been long under cultivation, and are much exhausted, but still exhabit a marked superiority over the great body which was originally sterile. From one third to fall for the benefit of all.

In this way no person could possibly incur loss, so as to leave our average profit for all our crops not very different from that of 1820. But whatever change may occur in price, it will not at all affect the "principle" on which these calculations are founded. All that is contended for is, that the amount of "nett product" is the measure and the proof of good husbandry; and from this propo-

quiry, propositions are advanced which appear

be a treat in the month of May!—As to the quantity to be raised for a family, eighteen rows, planted as above, across one of the Plats (little pid than before.

Which gives our practical men, he is the best farmer who cultivates in the month of most in return, and must ultimately tivates the greatest number of acres, and who derives the heaviest gross product from the planted as above, across one of the Plats (little pid than before. erally the only questions asked to decide on the

have yielded \$120 profit, and yet from the whole ved, was 1000 acres, or only ten. This however, 30 which may be saved without diminishing the a greater proportion of good, or a less proportion nures which change the constitution of soils .of poor land, than in the above example.—Such Improvements which are temporary in their ef- one half the arable land of the county, falls short

Suppose the clearing an acre of wood land, and expenditure. putting it in order for cultivation to cost \$12, and

Our theoretical, or improving farmers, by a culture is small, and its profits almost nothing; ry year, without diminishing, in the smallest dedifferent road frequently arrive at the same end, but we shall, notwithstanding, endeavour to gree, the farmer's nett profits. Every operation viz: diminishing the nett product, to augment shew, that we have the means for improvement discontinued was a certain source of loss, nor is the gross. They define good husbandry to consist in adopting every mode of enriching the soil, diminution of our clear annual profits. Capisarms, excepting their improvement. If then the and of making the different processes of cultivatal cannot be increased at will, although it is tion as perfect as possible, so as to make each not long since the belief prevailed that banking improvement of our soil, the change of more than acre produce to the utmost. This rule is derived and effect that impossibility.—That opinion four months of loss, to more than four months of ed from the publications and practice of Europe, and applied to American agriculture, without considering the great difference of circumstances. The rule is derived from the improvement of our soil, the change of more than four months of loss, to more than four months of however, is no longer supported, and even our gain, cannot fail to be greatly and immediately and applied to American agriculture, without considering the great difference of circumstances. If our capital cannot be made agree as a ware that many trivial bour cheap: it is therefore profitable to raise as may be reduced, till the proper proportion is may be raised against the reduction of our culmuch as possible from each acre, without much rerestored. This reduction is required even by garding the additional labour. In this country, land it unprofitably directed, abundant means for immost of our labour, and to estimate the quantity labour, time and fertility thus thrown away, ticular circumstances, the general question of exof land as of secondary importance: Even if the every one must estimate for himself; but many pediency must turn on such statements as the tised in Britain, would quickly lead to ruin; and sary and presuming in us to prescribe the pretion between improvements suitable to our time and labour for the purpose. situation, and such as are not, is a fruitful source of error, to young and enterprising farmers, twenty days in the year to repairing fences .-They are certain to bring upon themselves, se- As those on the dividing lines of adjoining pro-rious losses, and by giving practical men an op- prictors, are made at their joint expense, the portunity to triumph over book-farmers, their fences between the several shifts, require at least been mentioned, serious as they are, may be re-

same rule will shew, that many improvements cattle and sheep; but before we can admit this which are generally thought too dear, would be to be a loss of *profit*, it must be proved that some highly profitable. The least expense should be profit is derived from keeping stock in the usual it would be equally profitable, to lay out 10,000 now. dollars on the improvement of land, already in it amounted to \$60 only. Considerable as is the applies only to permanent improvement as clear- nett product of the farm. loss stated, but few farmers in the county have ing, draining, and the application of earthy mawe feel no disposition to exhibit a similar statement of the worst.

Improvements with a temporary in the religious poor land, than in the above example.—Such inspects with the county, lans short is the profit and loss arising from our best land.

Feets, such as more perfect tillage, or animal of 2½ bbls. which has been stated as the least and vegetable manures, to be profitable, must reproduct that will defray the expense of cultiment of the worst.

One half of our land is cultivated, not

its average product to be only 2 barrels; the re- insuperable obstacle to the improvement of agri- devoted ninety days, the whole crop being supgular loss attending its cultivation will be \$1, besides \$12 for the first improvement. Not one tract of the land regularly cleared yields sufficient nett product to repay the enormous exceptial, and their labour is already fully employed. This will save of our whole labour now unpense of the operation.

Every consideration of profit demands that this portion of our soil should not be cultivated while in its present condition. This will save of our whole labour now unpense of the operation. In England, land and produce are high, and la-equal to our cultivation, at least our cultivation and some real objections, (in certain situations,) is therefore generally to our interest to make the provement will be found. The full amount of are solid. Whatever may be the case under parof land as of secondary importance: Even if the every one must estimate for minister, but many preceding. If we have made an incorrect reclimate and products of the two countries were processes are so general, that we cannot err preceding. If we have made an incorrect reclimate and products of the two countries were processes are so general, that we cannot err preceding. If we have made an incorrect reclimate and products of the two countries were processes are so general, that we cannot err preceding. If we have made an incorrect reclimate and products of the two countries were processes are so general, that we cannot err preceding. If we have made an incorrect reclimate and products of the two countries were processes are so general, that we cannot err preceding. if the Lothian fallow, (the perfection of Scottish cise means of improvement which shall be adopthusbandry,) was adopted here, the whole crop of ed; these must vary in different situations, and possible for us to know our situation, and yet not wheat added to the fee simple of the land on our remarks are grounded on the supposition, receive benefit from such examinations of our which it grew, would not pay the cost of preparation. This neglect of drawing a line of distinction with the might improve with profit, could be spare farm cannot be effected at once; but no man can

The labour of a plantation is devoted about own bad habits are confirmed, and new obstacles one half of this time. By the discontinuance of moved by our own exertions. There are others, opposed to the progress of improvement. Those division fences we should save ten days' labour of no less magnitude, which are beyond our confrom grazing, and thus allow the land to improve agricultural interest by government, which can provement may be at one time good, and at ano- itself during the whole time of its rest. AMERICAN GRAPES AND WINE.

To the enquiry made of Mr. Adlum, through the National Intelligencer, and from that paper swer from Mr. Adlum, has since appeared in the

To the Editor of the Metropolitan.

SIR-I observe in your paper of yesterday, a communication from J. C. B. taken from the National Intelligencer, in which he says, "In the " years 1820 and 1821 I made a small quantity of " wine from the native grape. My method I think "a very imperfect one, not yielding a gallon of "juice to the bushel of grapes."—I presume Mr. J. C. B. must have used the small autumn, by some called the chicken or pigeon grape, from which, on account of the number of their seeds, a gallon of juice cannot be expected from a bushel But if he had the large growing fox grape, they will not part with their juice either from their skin or pulp without fermentation-if they are bruised or the skin merely broken and put into a tub covered for cutting Straw or top Fodder, that we with a blanket and suffered to ferment from have in this part of the country, for the price, three to six days, (according as the weather is (say \$20.) The person who cuts the straw, has warm) and until the whole pulp is dissolved, nothing to do but to turn the wheel after the and also the colouring matter in the skin, and straw or fodder is put into the box. The feeding the juice drawn or pressed off—I am much mis- works are so constructed as to bring forward the taken if a bushel of bunches will not yield from straw a proper distance ready to be cut by the two and a half to three gallons of juice—one bush-el of my Miller Burgundy weighed in the bunch-es thirty six pounds, the Schuylkill Muscadell and and despatch. The straw is brought forward October, in the year eighteen hundred and twen-ty-two; ending on the sixth day of January, eigh-teen hundred and twenty-three.

Constantia each weighed forty eight pounds in in the most simple manner, by means of a roll the bunches, and a bushel of them when picked ler fixed under the hind part of the box, to off the bunches, weighed sixty-one pounds; a bush- which is attached a cord, that passes along the el of the Tokay weighed fifty and a half pounds under side of the box over a small pully, placed in the bunches, and when picked off a bushel weighed sixty-five pounds—I had about one acre in bearing, but I only measured, with care, four tenths of an acre, which produced sixty-five and slides from the end of the box towards the front, a half bushels of bunches, and they yielded near when put in motion by the cord, and thus forces or about three gallons of juice to the bushel, and the straw forward at every turn of the wheel. it cannot be expected that a bushel weighing 34 The roller is moved by means of a screw fixed or 36 pounds will yield as much juice as those near the hindmost end of the fly-wheel shaft, so that weigh from 48 to 50 pounds.

Our small autumn grapes generally weigh from of the roller.

31 to 34 lbs. the bushel, and the large growing fox This mach grapes weigh from 44 to 48 pounds in the bunches; I purchased the patent right for this state. In-this difference in each kind I suppose is owing to their state of ripeness, or to the difference of the

others, for the planting of the vine, &c. until the ly with the wooden fly wheel, in a durable manwine is fit for use, as well as the management of ner, at \$15. A report of the Tobacco Inspected and de-our wild grapes, it is unnecessary to comply with I may now inform my friends and the public livered from the Indian Landing Inspection the gentleman's wish at present, with respect to that I am sincerely thankful for the very libe-

P. S .- If Mr. J. C. B. should visit Washington or George Town, and will favour me with a call, I can give him a taste of the wine made from the wild grape as well as the cultivated ones, both of which I think tolerable; and would at the same time answer any queries he may

DAYTON'S PATENT STRAW CUTTERS IMPROVED.

These are now made in a durable manner, and we believe that they would be found very useful and satisfactory, whenever the number of cattle to be fed, or the description of fodder to be cut, did not require more powerful, or more operative machines. We have seen one of them cut three pecks of straw in a minute; the only trial of it that we have witnessed, and in this the operator made unusual efforts; but we presume any one could easily make it cut straw at the rate of half a bushel per minute.-Ed. Am. Farmer.

This is considered one of the best machines as to turn a cog wheel that is placed on one end

This machine has been much improved since quantity of sugar contained in them

As I am preparing a memoir, in which my practice, as also the best I could collect from still continue, however, to make some as former-

ment, and increasing its variety, I hope to deserve the continuance of their favours. My stock consists of ploughs, cultivators, wheat-fans, straw-cutters, &c.; together with a general asstraw-cutters, and together with a general asstraw-cutters, and together with a general asstraw-cutters, and to sortment of smaller implements, such as shovels, spades, hoes, picks, mattocks, hay and dung forks, scythes, grain cradles, &c. &c.

Ellicot street, Pratt street Wharf, Baltimore. }

JEU D'ESPRIT -THE TREAD MILL. REFLECTIONS, METAPHYSICAL, PHYSIOLOGICAL, AND MORAL, EXCITED DURING A PROTRACTED COMMITMENT TO THE LABOUR OF THE TREAD

"Down! thou climbing sorrow!"

Lear, act 2, scene 4.

In order to introduce myself with due formality to the humane reader, I have to observe that I was found guilty of the crime for which I was arraigned-in the emphatic language of the Recortestimony of respectable and unvarying witnesses, by a mild and intelligent Judge, and by a merciful and considerate Jury;" and was senten-My first appearance on those boards was in March last. On the evening previously to my debut, the keeper came to me and said, that on the following morning, at half-past seven, my attendance would be required in company with other performers. There is always considerable interest produced by new situations and modes of employment; and on that occasion the interest partook more of alarm than of curiosity. My in-quiries were directed to ascertain if there required, any particular talent to comprehend, or dexterity of limb to execute, the task that had been assigned. The keeper assured me that the performance was adapted to the meanest capacities: "Sir, it only consists in putting the best in a marching regiment—it requires no previous study;" adding, that in one particular it might be compared to swimming, which is never forgotten: and that the latter result was the object of the contriver. At the appointed hour in the morning, I ascended a few steps which conducted me to my appointed station on the Mill .form; and it gave me sincere pleasure to find that neither competition nor jealousy existed, although we all wore the yellow stocking. A profound silence was maintained for the first three hours, when the person who worked on my right hand said, "They intend to convert this into a corn mill." The person on my left, overhearing him, replied, "It is a cursed contrivance for corns; my feet are blistered plready." Through-

By degrees I became better acquainted with my associates, the majority of whom concurred in reprobating the invention; they considered it impossible to effect a moral reformation by teaching a man to be a footpad. But there were some so physically callous and morally unrelenting, that the discipline seemed to make not the slight dera in next month, will make my assortment est impression on their bodies or minds. A felvery complete. I have also a general assort-low, who was a lamp-lighter, laughed at the la-ment of grass seeds. The prices of these are li-bour: he said it was much easier than his own ment of grass seeds. The prices of these are li-bour; he said it was much easier than his own able to great fluctuations, owing to excess of trade, and he should consider the period of his demand, or scarcity. But my prices will ever be as moderate as possible—and at present they are for Red clover seed, \$8—Orchard grass, \$3 50—Herds grass do. \$3—Timothy do. \$5—Millet, \$2—all of the first quality.

A many whole time is necessarily exercised in trade, and he should consider the period of his commitment as an holiday. A short thick-set lad, who was a pot-boy, declared that drawing beer all day and the greater part of the night was much more fatiguing. A chimney-sweeper said, it was a clean and genteel profession; and a Radical affected to admire the invention, because it proceeded on revolutionary principles. A hu-mourous chap, who was classically educated, and collect small sums from persons who live in the had a poetical turn, called the Mill the gradus country, which places me under the necessity of ad Parnassum, and the labour, scanning. Sufdetermining not to sell upon credit in future to fice it to say, that the same unvarying and monotonous rotation continued during the period of my commitment.

It now remains to communicate the reflections that occurred while I was a working bee in this discipline and intended castigation on the moral hive of reform. For the first week the treading character; and this explanation I will cheerfulwas distressing, and accompanied with considera-ble pain and stiffness in the calves of the legs and with whom I have conversed may be considered muscles of the thighs; this, however, gradually a fair criterion. It is supposed that idleness is diminished, and in the course of a month I per-the source of vicious propensities, and inferred formed the labour with alacrity, and only viewed that a return to industrious habits will engage the it as a species of training. The appetite was mind in honourable pursuits. This is the ordinuch increased; but for this salutary symptom nary mode of reasoning; but it is founded on there was no extra provision, the means of sa-tisfying the increase being denied. As the toil proceeded, the thread of life was spun from a and hazardous enterprizes. He is compelled to staple progressively finer; and when the six exert his faculties in the contrivance of stratader, "after a patient and impartial trial, by the months had expired, a very delicate filament aptestiment appeared to connect together the body and the soul. the pursuit of justice.* When other mortals are This labour, with restricted diet, would be a cer-tain remedy in cases of obesity; and the Mill prowls about, regardless of the inclemency of the ced to six months hard labour in the Tread Mill. might be safely recommended to the Court of weather, and conceals himself in ditches that he Aldermen and their deputies; masters and war- may spring upon the traveller. If employed in dens of companies; churchwardens, overseers, the fabrication of bank notes, or in counterfeiting

That the Tread-mill, under proper regulations, may become a valuable agent in the cure of chronic disorders, there is every reason to expect; and it is to be hoped that valetudinarians may be accommodated with some establishments by-paths, and traverse immense tracts, that he for this purpose. In wet weather, under proper shelter, sufficient exercise might be taken in the ger; he shuns the garish eye of day, and often open air without the chance of catching cold; and as the circular wheel resembles the cylinder of a hand-organ, a trifling expense would furnish foot foremost; you have only to consider yourself large set of delightful tunes, commencing with solemn adagios, and progressively advancing to the gayer movements of a waltz. Time, and the rapid march of intellect, will at some future period develope the improvements of which this salutary engine is susceptible. have conspired against him, and he regards his fellow as an antagonist. It is not idleness that salutary engine is susceptible.

The effects produced on the mind by the operaducted me to my appointed station on the Mill.—tion of the Tread-mill are highly interesting, and lus that constantly goads him to practice; it is deserve to be accurately communicated. Alform; and it gave me sincere pleasure to find though it may be described as the dull unvaried

"Diverse lingue, horribili favelle,
"Parole di dolore, accenti di'ira."

Dante, Inferno. Canto 3.

Independently of the strict injunction to preserve silence, there is a physiological reason for the stillness that prevails; in all states of exertion where the labour exhausts the strength, mum is the order of the day—the respiration is too actively employed to permit a sufficient supply of breath for continued articulation. That faculty of the mind which is termed attention becomes wonderfully improved, and in consequence the memory is enabled to revert to the former incidents of life with the greatest accuracy, and keep the immediate subject of thought steadily in contemplation. One of my comrades, who was a strolling player, rehearsed many parts while in the act of treading, and, by his own account, with greater facility than he had ever done before; and this he explained, by ascribing it to the relief he experienced while "plodding" round about "his weary way," in fixing his at-tention on those dramatic scenes with which he had heretofore stored his memory. He pleas-

antly called it learning by rote. The reader and the public will now expect that I should detail the practical operation of this and sidesmen; butchers' wives, and landladies the coin, his exertions are more laborious and in the districts of Wapping. san. Cupidity is the stimulus to his unremitted toil, and the fear of surprise and apprehension banishes the refreshment of sleep. Ever on the alert to avoid detection, he is compelled to seek may more effectually screen himself from danfasts till nature is nearly exhausted. When there is a reward proclaimed for his caption, he views his own species with distrust, knowing that the thirst of gain will induce even his associates to betray him; and he feels that he can no longer confide in the wretched female on whom he has lavished his plunder. Mankind appear to is the cause of his delinquency, for the propensity to thieving, in all its departments, is a stimuthe eagerness to attain promptly that which he considers the object of his wishes-the desidera-

THE CURING OR PRESERVATION OF MEAT WITH THOUGHTS ON THE CAUSES OF RUST. Elmwood, January 10th, 1822.

DEAR SIR,

We had some conversation lately about the yellow rust, that is so disagreeable in bacon; and I referred you to a paper in your Farmer, vol, 2, on that subject. To the causes there assigned, I have to add another, that I did not know of then; and perhaps it is the most gene- ried off in this way, but they have only to look ral, viz: the moisture and closeness of the meat at a brick house near the coast to be convinced;

propriates the money he has collected in his ser-vice to decorate his person, that he may indulge of curing meat—and a proper combination makes J. S. SKINNER, Eso. exhibitration kindled by fermented liquors, or sider as merely a flavour, notwithstanding what the produce of distillation, presents a new source of pleasurable feeling. Under the influence of a little pyroligneous acid to cure meat. The wine, the bashfulness and timidity inseparable Londoners, I am told, have no smoke houses; properties, they would confer an obligation, by from chastity and decorum are utterly dispersed; they simply dry their meat in the kitchen. making it public through the medium of your the tongue acquires extraordinary facilities of Meat that is excessively salted by laying very paper. I have been led to this inquiry by seeing expression, scorns confinement to the dullness of long in plenty of salt, as also such as is exfact, and sallies into the gayer regions of false-cluded from the air, as barreled pork, is not appeared to possess, from the manner of their apt to grow rusty, but by very long keeping. burning, a quantity of oil.

Among all the conveniences that can be enu-Hence it follows, that our nicest meat is most in haste, your obed merated, especially with the community to which in danger; and the pieces we salt least are the I belong, a lie is justly entitled to the prefermost apt to be rusty, viz: chines, joles and ence. It is an indispensible requisite in the chamiddlings. Hams are the least liable, because racter of a thief, and has presented abundant kept longer in salt, and more protected by skin. scope for the ingenuity of gentlemen of the longcellence depends on the readiness with which carried off by the air, taking up the saline it is produced, and on the unblenching effrontery with which it is maintained. Young beginners whereas, when it is dried quickly, the reverse generally hesitate, colour up, and look down; the eye of a proficient rivets your attention by a meat will condense the salt, and it will crystapoint-blank regard. The emoluments of all pro-fessions and the profits of trade are founded on would do best to be first dried in a kitchen, yet taken effect in that particular. Thus the desire of gratification produces the activity which distinguishes the restless life of a rascal.

Speaking from the moral benefits I have derived from this Mill, my expectations are not raised to any high degree; it may in the outset be felt as a punishment, but this, like the nap of a new coat, soon wears off, and by habit becomes merely a salutary exercise. It may possibly be employed with advantage for the correction of beggars, who are really idle; but to reform thieves it is wholly inadequate. It the light of even the salutary exercises are not to reform thieves it is wholly inadequate. It the light of even the salutary exercise are not to reform thieves it is wholly inadequate. It the light of even the salutary exercise are not as the first and colour rapidly when the rapidly when the houses should be constructed so as to be dry and airy. None should but the ground—but the groun to reform thieves it is wholly inadequate. such tempting stuff.

Such smoke houses as are built over other houses, should have a large flue from the bottom, but the fires should never be put there, or the meat will keep damp-and moreover have a bitter taste-for the warm smoke will be condensed on the bacon by the relative coldness. This I have experienced.

There is much dispute with house keepers whether we should smoke in damp seasons, when the meat is dripping. I consider it safest not to smoke; for if you do not succeed in drying it, which can hardly be done so quickly, you will injure the meat much more than the weather will.

SILVANUS.

* Some chemists might deny the salt being car house. I was led to this discovery by keeping there they will see the salt 100 feet or more, some meat, that was ready for smoking, three above the water level:

ing through the Southern States.

The fourth volume, now publishing, can b forwarded to any part of the United States, on application being made, by letter or otherwise, to J. S. SKINNER, Baltimore.

Printed every Friday at £4 per annum, for JOHN S. SKINNER, Editor, by JOSEPH ROBINSON, at the North West corner of Market and Belvidere streets, Baltimore; where every description of Bost and Job Printing is executed with nearness and despatch—Order from a distance for Printing or Binding, with proper direction promptly attended to, addressed to J. Robinson, Baltimore.

CHAPTER IV.

Vegetables and Herbs.

199. BROCOLI .- This plant is not much culthat season is worth some trouble, and even some winter to winter.

THE AMERICAN GARDENER have a sort of net-work over the whole planta- a sharp spade along under the rows, and cut off tion. And, there let it stand, till the rains are the tap-roots; for they must be shortened when over, and until the winter is fairly set in, which the plants are transplanted. This, if done a week at New York, may be about Christmas. When or tendays before transplanting will give the plants all is frozen hard up, cover close over the lattice a more bushy root; and will, in some measure, 199. BROCOLI.—This plant is not much cultivated in America; and, indeed, scarcely at all lay on something to prevent the straw from mo-plants ready for transplanting; and having the In England it is grown in great quantities, especially near London. It is there sometimes the sides and the ends of the erection. Place spring, and eaten in the fall and during the winth the straw or stalks a foot thick at least, and fas plants up, that is, loosen the ground under them ter, even until spring. It is of the nature of the cauliflower, which see. One sort has a whitish head, and is like a cauliflower, except that the light and all occasional thaws from entermed on their roots. Put them in rows of course. The setting-stick should be the upper part of a cauliflower, except that the light and all occasional thaws from entermed their roots. Put them in rows of course. The setting-stick should be the upper part of a cauliflower, except that the light and all occasional that the breakwhite is a yellow-white. Another sort has a furhead; and the letting-stick should be the upper part of a
white is a yellow-white. Another sort has a furhe head; and there is another of a greenish hue.
It is cultivated, in all respects like a Cabbage
(which see); but, as it is large, it must be platake away as soon as the grand breaking up
the eye to the point of the stick. From the bottom of

take away. If raised very early in the
the middle of March (Long Island 1) and though way down to within an inch and a half of the a half each way. If raised very early in the spring and planted out in June, and in good there will be many and sharp frosts after this, ground, as cool as can be got, it will have heads these will not injure the plants. As soon as the in October; and, if any of the plants have not ground is dry at toh, hoe deep amongst the plants; ness of a dollar, and iron put round in its stead, then perfected their heads, when the hard frost hoe again in about ten days; and again in anothing it makes a very complete tool. The iron becomes spring sown cauliflowers which have not perfect or in the second at latest, you will begin to cut does not adhere to it, as it spring sown cauliflowers which have not perfect or in the second at latest, you will begin to cut does not adhere to it, as it does not adhere to it, as it spring sown cauliflowers which have not perfect. Brochlot the second at latest, you will begin to cut the stick in the other, make a hole suitable to the fall way be crought and they must be crought to cut that the total process of the stick in the other, make a hole suitable to the fall way be crought and they must be crought to cut that the total process of the stick in the other, make a hole suitable to the fall way be crought to cut the stick in the other, make a hole suitable to the defined heads at this season. Fifty of this plant, for the fall, may be enough; and they ought to be planted out in the South Border in order to be kept as cool as possible. The white sort is deemed the handsomest; but, the others are more of the handsomest; but, the others are more plant to say, in May (for New York) is the thing!—

The thing may be done; for I had some pretty good in May 1818.—Sow in June. Transplant in July; put the plants at 2½ feet apart. Till well be ween; and earth up the stems of the plants are day and make the lattice work and out roots from all the parts of them that are July; put the plants at $2\frac{1}{2}$ feet apart. Till well be hired expressly, would he not go to the wood between; and earth up the stems of the plants in August. They will be very tall and stout, in good ground, in November; and a sharp frost or two will not hurt them. But, to keep them dollars; and, supposing the straw and the stakes and rods to be bought, the straw would be nearly as good for litter afterwards, and the fastening of the plant in the ground. It is good, therefore, to plant as deep as you can without injury to the leaves.—The next consideration is, the fastening of the plant in the ground. It is good, therefore, to plant as deep as you can without injury to the leaves.—The next consideration is, the fastening of the plant in the ground. It can not do better than repeat here what I have said in May, and, at Philadelphia late in April; to have something little short of a cauliflower at if tied up in bundles and laid safely away from that season is worth some trouble, and even some winter to winter. "roots; but the root should not be bent at the expense; for, at that very season, the people of 200. BURNET is a well known grass, or catNew York, are carrying home wild dock leaves the plant. It is used by some in salads. When hand holds the plant, with its root in the hole, from market, bought at three or four cents a bruised, or cut, it smells like cucumber. It is a "the other hand applies the setting stick to the hand applies the setting stick to the handful! This is the way to go to work to have perennial, and a very poor thing.

Brocoli at this season. Five rows, across one of 201, CABBAGE.—The way to raise Cabbage "held in such a way as to form a sharp triangle the Plats in the garden, will contain 110 plants. Plants in a hot-bed has been given in Paragraphs" "with the plant. Then, pushing the stick down then the plant. the Plats in the garden, will contain 110 plants. The space they will occupy will be 56 feet long, and 10½ feet wide from out-side row to out-side row. Now, all this space must have a covering during the time that the ground is completely locked up by the frost. And this is the way to cover it. Before the ground ob hard frozen, put some stout stakes in the ground on both out-sides of the out-side rows, and at about a foot from the stems of the plants, Let these stakes be about a foot higher than the tops of the leaves of the plants; and that will make the stakes about four plants; and that will make the stakes about four the frost in mind. But, to have fine cabplants; and that will make the stakes about four their contents in mind. But, to have fine cab- against which the earth ought to be pressed, for feet high. Let these stakes (which should not bages, of any sort, the plants must be twice trans-beless than three inches through) have a fork at planted. First, they should be taken from the earth closely, the plant will not thrive. To know the upper end to lodge a pole upon to go from seed bcd (where they have been sown in drills whether you have fastened the plant well in the stake to stake across the plantation. That these near to each other,) and put out into fresh-dug, ground, take the tip of one of the leaves of the poles may not bend in the middle, by and by, well broken ground, at six inches apart every plant between your finger and thumb. Give a when the covering is not to be plant well as for as for the when the covering is put on, put another row of way. This is called pricking out. By standing pull. If the plant resist the pull, so far as for the forked stakes along the middle, or near the middle of the plant is properly dle of the plantation. From out-side row of and strong, stand erect, and have a straight and fastened in the ground; but, if the pull bring up stakes to out-side of stakes will be twelve feet stout stem. Out of this plantation they come the plant; then you may be sure that the plantand a half. The stakes are to be four feet asun-nearly all of a size; the roots of all are in the ing is not well done. The point of the stick ought der in the long rows, and they will be about six same state; and, they strike quicker into the to twist and press the earth up close to the hoint feet asunder across the plantation. Lay stout ground where they are to stand for a crop.— of the root; so that there be no hollow there.—
poles across, and let each pole rest in the forks but, if you do not, whether from negligence or Pressing the earth up against the stem of the of the three stakes. Then tie some stout rods want of time, prick your plants out, choose the plant is of little use. As to distances they must longways upon the poles, at about nine inches strongest, if you do not want them all; and, be proportioned to the size which the cabbages from each other. Then some small rod across at any rate, do not plant strong and weak pro- usually come to; and the size (difference of soil them at nine inches from each other. Then tie miscuously, but put each by themselves. If you out of the question) varies with the sort. Howsmall rods along the sides and at the ends from do not intend to prick out, leave the plants, thinstage to stake, nine inches apart, and upright ner in the seed bed, and hoe deep between them and Early Sea Green, a foot apart in all direcrods against these, nine inches apart. Thus you while they stand there. Besides this you may pass

INNER, Edier of Market tion of Book patch—Orders patch—Orders per directions norce garden ground; and you do not want such things place. The barn is worse. The cabbages get the breaking-up comes, take off the covering, and

to stand long, and the plants are in plenty as to futrid parts about them. If green vegetables be stir the ground (as sown as dry,) by hoeing, number. The next size is the Early York, which not fed from the earth, and be in an unfrozen amongst the stumps. They should be placed in may have 16 inches every way. The Sugar loaf state, they will either wither or rot. Nothing is an early shot; in one of the warmest places you may have 20 inches. The Battersea and Savoy nastier than putrid cabbage; and one rotten cab-have; and they will give you (at New York) an two feet and a half. The large sorts, as the bage will communicate its offensiveness to a whole abundance of fine greens towards the end of April, Drum-head and others, 3 feet at least.—Now, parcel. Pits you cannot open in winter. To when a handful of wild dock-leaves sells in New with regard to tillage, keep the ground clear of turn the heads down and cover them with earth York market for sixpence York money, which is weeds. But, whether there be weeds or not, while the root stands up in the air, is liable to the rather more than an English three pence. hoe between the plants in ten days after they are same objection. The cabbages are pretty safe; planted. The reasons for this are amply stated but you cannot get at them during the winter. I cabbage is a biennial. It brings its flower and its in Paragraphs 176 to 186. You cannot dig be-have tried all the ways that I ever saw practised, seed the second year. To have cabbage seed, tween the plants, which stand at the smallest dis-tances; but you may, and ought, to dig once, if I found to answer every purpose: it is the su-root and all, throughout the winter; and this not twice, during their growth, between all the rest preservation, and gives the least trouble, must be done, either in a cellar, or, under coverrest. To prevent a sudden check by breaking all the rest preservation, and gives the least trouble, index be done, either in a cellar, or, under covers the roots at once, in hot weather, dig every other away for use.—Lay out a piece of ground, four interval, leave the rest, and dig them a week feet wide, and in length proportioned to your later. All the larger sorts of cabbages should, about the time that their heads are beginning to about the time that their heads are beginning to form, be earthed up; that is, have the earth from the earth up on the four-feet bed. Make four, or five years, the little pains that the preservation, and gives the least trouble, must be done, either in a cellar, or, under covers whether in the least trouble, in go for some sort out of doors; for, the root must be done, either in a cellar, or, under covers in the taking ing of some sort out of doors; for, the root must be done, either in a cellar, or, under covers whether in the putting together or in the taking ing of some sort out of doors; for, the root must be done, either in a cellar, or, under covers in the taking ing of some sort out of doors; for, the root must be done, either in a cellar, or, under covers ing of some sort out of doors; for, the root must be done, either in a cellar, or, under covers in the taking ing of some sort out of doors; for, the root must be done, either in a cellar, or, under covers in the taking ing of some sort out of doors; for, the root must be kept in the ground all whether in the putting together or in the taking ing of some sort out of doors; for, the root must be done, either in a cellar, or, under covers in the taking ing of some sort out of doors, for, the root must be done, either in a cellar, or, under covers in the taking ing of some sort out of some so the surface drawn up against the stem; and, the the top of the bed level and smooth. Lay some vation can require is not worth the smallest risk. taller the plants are, the more necessary this is, and the higher should the earth be drawn. After upon the bed. Then put some smaller poles, or the earth has been thus drawn up from the surstant states and the higher should the earth be drawn. After upon the bed. Then put some smaller poles, or the earth has been thus drawn up from the surstant states.

As to the quantity of cabbages wanted for a family, it must depend on the size of the family and on their taste.

Let the plants are, the more necessary this is, poles, or old rails, at a foot apart, long-ways, last to the quantity of cabbages wanted for a family, it must depend on the size of the family and on their taste.

Let the plants are, the more necessary this is, poles, or old rails, at a foot apart, long-ways, last to the quantity of cabbages wanted for a family, and on the earth has been thus drawn up from the surstant state.

Let the plants are, the more necessary this is, poles, or old rails, at a foot apart, long-ways, last to the quantity of cabbages wanted for a family, and on the earth has been thus drawn up from the surstant state.

Let the plants are, the more necessary this is, poles, or old rails, at a foot apart, long-ways, last to the quantity of cabbages wanted for a family and on the size of the size of the family and on the size of the size of the size of the Thus the crop will be brought to perfection.—As these lay, corn-stalks, broom-corn stalks, or twigs like the cucumber, which see.

to sorts, the earliest is the Early Dwarf (sometimes called the Early Salisbury;) the next is thick just to cover all over. Make the top flat There are several sorts of it; and, it is, in all returns the Early Sea Green; then comes the Early and smooth. Then, just as the frost is about to spects, propagated and cultivated like the Green York. Perhaps any one of them may do; but lock up the earth, take up the cabbages, knock all Savoy, which see under Cabbage. The Cale the first will head ten days sooner than the last. dirt out of their roots, take off all dead or yellow does not head, or loave, but sends forth a loose, The Sugar-loaf, sweetest and richest of all cab-looking leaves, and some of the out side leaves open top, which in England, is used after the bages, if sown and transplanted when Early besides; put the cabbages, head downwards, frost has pinched it, and then it sends out side-Yorks are, will head nearly a month later. It is upon the bed, with their roots sticking up; and shoots from its tall stem, which it continues to do an excellent cabbage to come in, in July and cover them with straw so thick as for the straw to if kept cropped, till May. In mild winter cli-August. Some sown three weeks later will carry come up nearly to the root of the cabbage. Do mates it is very useful and pleasant. It does not you through September and October; and some not pack them quite close. It is better if they get rotted by the successive freezings and thawsown in June and transplanted in July, will carry upon to touch each other much. Lay some bits of ings, as cabbages do. It is always green and you on till Christmas. For the winter use, there wood, or brush-wood, to prevent the straw from fresh. Backward planted savoys, may, perhaps really needs nothing but the Dwarf Green Savoy. blowing off. If the frost catch you, before you be as good; but the Cale is very good too. It When good and true to kind it is very much have got the cabbages up, cut them off close to will, I dare say, stand throughout some winters as curled and of a very deep green. It should be sown as soon as the ground is at all warm, and planted out as soon as stout enough. By No-stack you will take your cabbages perfectly green Curled Cale is the best.—Its seed is saved like vember it will have large and close heads weigh- and good in the spring, when the frost breaks up; that of the cabbage.—There is a sort of Cale ing from 5 to 8 pounds each. This is the best of and to this stack you can, at all times in the win- called Boorcole, and a whole list of things of all winter-cabbages. If you have Drum-heads, or ter, go, with the greatest facility, and get your somewhat the same kind, but to name them other large cabbages, the time of sowing and that cabbages for use, which you can to no other spe- would be of no use. of transplanting are the same as those for the cies of conservatory that I ever saw or heard of. Savoy. But, let me observe here, that the early sorts of cabbages takes away laferior in point of quality to no vegetable but sorts of cabbage keep, during winter, as well as all wet that may come from occasional rains or the Asparagus, superior to that in merit of the large, late sorts. It is an error to suppose, meltings of snow; and the little ditches on the earliness; and, though of the easiest possible prothat those cabbages only, which will not come to sides of the bed keep the bed itself free from pagation and cultivation, I have never seen any perfection till the approach of winter, will keep being soaked with wet. Even if deep snows come of it in America.—It is propagated by seed, and well. The Early York, sown in June, will be and lie for months, as in Nova-Scotia, New also by offsets. The seed may be sown, and right hard in November, and will keep as well as the Drum-head, or any of the coarse and strong-snow a little; and here are the cabbages always (little shoots from the sides of the stems) planted smelling cabbages. The Early Yorks are not so fresh and good.—Immense quantities, particubig as the Drum-heads; but, observe, that as the larly in woody countries, may be stacked and preformer require but 16 inches distance, and the served in this way, at a very trifling expense. In same in all respects as Asparagus; except that latter 3 feet, five of the former stand on the fields the side trenches would be made with the the Cale may be begun upon the second year ground of one of the latter. So that, perhaps, plough; poles, in such a case, are of all sizes, Cover the beds thick with litter in winter; so that the Early Yorks will be the largest crop after all. always at hand; and, small brush wood might do the frost may not enter very deep; and, in April I have tried the keeping of both: and I know, very well instead of straw, fir-boughs, laurel- (Long Island) you will have plenty.—The moment that the fine cabbages keep as well as the coarse boughs, or cedar-boughs, would certainly do bet- it peeps out, cut it, and you have a white stalk ones. The Red Cabbage is raised and cultivated ter than straw; and where is the spot in America, seven or eight inches long, which is cooked just in the same season and same manner as the which has not one of these three?—Cabbage as asparagus is, and is all eaten from top to bot-Green Savoy.—There are many other sorts of Stumps are also to be preserved; for they are cabbage, early as well as late; and they may be very useful in the spring. You have been cut- and is as hardy as any weed that grows. Instead tried; but those above-mentioned are certainly ting cabbages to eat in October and November. of earth you may, if convenient, lay sand (and sorts enough for any family.—The preserving of You leave the stumps standing, no matter what especially sea sand) for it to shoot up through. cabbages during the winter is all that remains to be the sort. Take them up before the frost sets It may be moved at any age of the plant. Any be treated of under the word cabbage; but as in: trim off the long roots, and lay the stumps in old stump of it will grow. After you leave off every reader must know, it is a matter of great the ground, in a sloping direction, row behind cutting it in the spring, it goes shooting on, and, importance; for, on it depends the supply of cabbages for four months in the year, North of Virground. When the frost has just set in in earness, stalks are cut down, and you proceed with the ginia and South of Boston, and for six months in and not before, cover the stumps all over a foot oeds as with those of Asparagus,-Two beds the year when you get as far North as the Pro-thick or more, with straw, with corn-stalks, or across any one of the plats are enough for any vince of New Brunswick.—The cellar is a poor with ever-green boughs of some sort. As soon as family.—This is, unquestionably (after the Aspa-

as that of Asparagus.

ragus) the very best garden vegetable that grows. covering, occasionally at least, of some sort; and seed in June.—The quantity sea-Cale may be had at any time in winter, as the covering is, almost always glass, either on easily as Asparagus (which see,) and with less trames or in a hand-light. So that, to keep them but, it is so much better than the very best of care. The roots may be dug up in the fall and through an American winter, there must not only cabbages, that it is worth some trouble to get it. thrown under any shed with litter, or straw, over be glass, but that glass (except where you have a them, till you want them. The earth in the hot-green-house to be kept warm by fire) must have a bed must be deeper than for Asparagus: that is covering in severe weather.—They require age, all the difference.—The seed is saved as easily and yet, you must not sow them too early in the fall; for, if you do, they will have little heads 205. CAMOMILE is a medicinal herb of about the size of a dollar, and go off to seed at The Committee on Agriculture respectfully beg great use. It is a perennial, and, though it may once without coming to a large head at all. If you be propagated from seed, it is easiest propagated by parting the roots. One little bit of root will soon make a bed sufficient for a garden. The flowers are used in medicine. They should be gathered before they begin to fade; and be dried in a gentle sun, or in shade; and then put by, in paper bags, in a dry place.

206. CAPSICUM (or Peppers.)—An annual plant sown early in fine earth, in drills a foot matural ground, and do not put much dung in the latter of the propagated in sowing, the heads do not begin before the great heat comes; and, in that case, they will not head till the full.—All these circumstances make the raising of them for spring use very difficult.—Sow (Long Island) first week, or second week, in September, in the same manner that it imparts life and vigour to every other employment in the commonwealth. This duty is rendered the more imperative at this time, from natural ground, and do not put much dung in the latter of the great head at all. It you be too backward in sowing, the heads do not begin that case, they will not head till the full.—All these circumstances make the raising of them for spring use difficult.—Sow (Long Island) first week, or second week, in September, in the same manner that it imparts life and vigour to every other employment in the commonwealth. This duty is rendered the more imperative at this time, from natural ground, and do not put much dung in the leaves of the force of the force of the great head comes; and, in that case, they will not head till the full.—All these circumstances make the raising of them for spring use times, the fostering aid and protection of the leaves, they will not head till the full.—All these circumstances make the raising of them for spring use to spring use times, the fostering aid and protection of the leaves, they will not head till the full.—All these circumstances make the raising of them for spring use to spring use to such that they will not head till the full.—All these circumstances make the raising of them for spring use to sprin plant, sown early in fine earth, in drills a foot apart, and at six inches apart in the drills. It is handsome as a flower, and its pods are used as a would be the place. Plant them six inches asunductions of foreign countries. The wheat of the der upon a piece of ground that your frame will Baltic, and the products of the Irish soil, are al-207. CARAWAY.—The seeds are used in cakes. The plant is an annual. Sow in the spring, in fine rich ground, and leave the plants eight inches apart each way.

der upon a piece of ground that your frame, till sharpish ready imported into our state. The continental ready imported into our state. 208. CARROT.—Read the Article Beet; for, on, but give plenty of air. Take the lights of the same season, same soil, same manure, same preparation for sowing, same distances, same intercultivation, same time of taking up, and mode of preserving the crop, all belong to the Carrot.—About the same quantity also is enough for a large transfer of the preserving the crop and belong to the Carrot. The put long dung from the stable very thick all round the frame up to the very top of it, and extending a yard wide; and, in severe weather, cover the states during the last year, exceeded the exports of our own productions, seventeen millarge family.—Some fine roots may be carefully straw upon the mat; and then cover the straw tions of dollars: that our specie and public stocks preserved to plant out for seed in the spring; and with another mat. But, mind, they must be kept have been withdrawn from the country towards the seed should be taken only from the centre in the dark as little as possible. When the sun is meeting the deficit; and that still an awful baseed-stalks of the carrots; for that is the finest. The mark of a good kind of seed, is, deep-red colour of the tap. The paler ones are degenerate; and the yellow ones are fast going back to hoe and stir the ground; for, they want strength the means calculated to effect reform, your comthe wild carrot. Some people consider that there as well as protection; and they must have all the mittee consider the improvement of agriculture, are two sorts: I never could discover any diffe- air you can, with safety to their lives, give them. by the introduction of improved and profitable rence in the plants coming from seed of what has the general Indian-Corn planting season. By this couragement of domestic manufactures—and a ridouble her milk, if taken from common pasture time you may leave the lights off day and night. gid economy in every department of the governin October, and fed well on carrot greens, or tops; Ten days before Corn-planting get your ground ment, as holding a pre-eminent rank, and as entiand they may, at this season, be cut off for that ready, deeply dug and full of rich manure. Make tled to the peculiar consideration of this legislapurpose. They will shoot a little again before holes with a spade; remove each plant with a bail ture. As the former of these only, falls within the time for taking the carrots up; but, that is of earth about the roots; fix the plants well in the province of this report, your committee beg of no consequence. These shoots can be cut off holes at two feet asunder; leave a little dish round leave to explain their views upon this subject at before the carrots be put away for winter. Carrots will transplant like Beets; but, they grow still more forked than the Beet in this case.—
They do, however, grow large and heavy in this way. I have had some weigh more than three days in hot weather; hoe and dig between them of law, of medicine, and of divinity. We have saled a some weigh more than three days and you will have Carliflow as in large and leave to explain their views upon this subject at length.

Your committee cannot but regret, that so little some way. I have had some weigh more than three days in hot weather; hoe and dig between them of law, of medicine, and of divinity. We have schools are two results at two rest at two rest at two rest as the rest as the rest as two rest pounds.

209. CAULIFLOWER.—It is not without you have a Green-house, the trouble is little. Sow we have a national school for teaching the art of as before. Put about four plants in a flower-pot war. The fine arts have their teachers, pupils, and amateurs. The shops of our merchants, mein winter, and especially where the summers are frame. They will live in the Green house like chanics and artizans, are all schools of instruction, as hot as they are in every part of the United other plants; and will be ready to put out as where our youth are taught, by system and rule, as hot as they are in every part of the United States. Still it may be brought to perfection.—
States. Still it may be brought to perfection.—
It is a cabbage, and the French call it the flowercubbage. Its head is a lump of rich pulp, instead of being, as a cabbage-head is, a parcel of leaves dear in the full is a much easier matter, and then they are to follow. Yet we have no school of agriculture,—a business more complicated in its details, and requiring a greater diversity of knowledge, than any art they are, in my opinion more valuable than in the same time and in the same time and in the same way; put them at two feet and hot a plants in the same way; put them at two feet and not not a pot, as in the cabbage, a lump of leaves, but the agriculture.

The cabbage, a lump of leaves, but the cabbage, a lump of leaves, but the agriculture are taught, by system and rule, where our youth are taught, by system and rule, the particular business which they are to follow. Yet we have no school of agriculture,—a business more complicated in its details, and requiring a greater diversity of knowledge, than any art which is severely, but justly other. The Cauliflower is an annual plant. It is spring. Sow at the same time and in the same way as the devout Mahomedans do the small pox; is sown; and, in fact, the part which is eaten is plants in the same way; put them at two feet and regard the tedious process of inoculation on not not, as in the cabbage, a lump of leaves, but the a naif distance; you need not now water them: not, as in the cabbage, a lump of leaves, but the a haif distance; you need not now water them; both as useless and simul. Though agriculture seed stalks, hods, and blossoms in their embry, and they will begin to come early in October; and, is the parent of the arts, and the mint which coins compact state, before they expand.—It is the same if any of them have not perfected their heads when our wealth, so modest has been its pretensions, with Brocoti.—Cauliflowers may be had to eat the sharp frosts come, take them up by the root, so humble its walk, and so feeble its advocates, in the fall, or in the spring. struggle for itself, against the corn laws of Europe, unprotected and unnoticed.

Agriculture, says an emment statesman, may be regarded as the breasts from which the state derives support and nourishment. Commerce, the arts, literature, manufactures, and the refinements of social life, nay, the principles of civil liberty, depend materially for their advancement upon the progress of agricultural improvement. " Britain, says a late writer, "has hitherto matched any part of the world, in a knowledge of the arts, and in the practice of trade and manufactures. The origin of that knowledge, and the source of those practices," he continues, "may, in a great measure, be traced to the improvement of agri-This art forms the basis, or foundation, on which all others are reared; and as it is more perfect in Britain, than in other countries, commerce and manufactures have risen to proportional excellence" To show the governing influence of agriculture, upon the moral and political condition of society, we have but to turn our eyes to Europe. The Campania of Rome, which once was a garden, and boasted of more than twenty cities, is now a noisome waste; and the character of its few inhabitants have degenerated as its agriculture has declined. Sicily, once the granary of imperial Rome, has, like its mistress. become unproductive, effeminate and debased. And yet the soil of both the Campania, and of Sicily, are celebrated for their fertility. Look to Spain, to Portugal, and to European Turkey. Why have commerce, the arts and learning, languished in those countries for centuries? Because agriculture their nursing mother, has been neglected and

If, then, agriculture is the fountain from whose abundant streams every portion of our country is watered and enriched,—how important is it that we should watch over it with a paternal carethat we should disseminate its improvements, and endeavour to multiply its blessings;-that we should elevate it to the rank of a liberal and fashionable study, and call in the aid of science, and of approved experience, to enlarge the sphere of its usefulness. To effect these desira ble ends, your committee respectfully recommend, that a law be passed, for establishing a school of agriculture, for the education of our young men in the practice and theory of husbandry.

untried experiment; that we have no precedent to guide us; and, that did schools of agriculture promise important benefits to a state, they would long since have been multiplied in other countries. It should be borne in mind, that the inducements to disseminate knowledge among the agricultural cise and instruction to the pupils. class, are no where so strong as in the United States; and that what is deemed salutary here, may be dangerous on the other side of the Atlan-There, the few, who constitute the privileged classes, are the proprietors of the soil, and rely, for the preservation of their power and their wealth, upon the comparative ignorance and depression of the many. Here, those who till, are the owners of the soil, and the legitimate depositaries of power; and the purity and permanancy of our political institutions, are based upon their chanic art, in shops attached to the establishmen intelligence and virtue. In Great Britain, the want where most of the useful trades are carried on. of agricultural schools has been supplied, by in-dividual liberality and enterprize. Many of the great landholders, stimulated by an efficient na-states, as well as from the neighbouring cantons, shall not be long without them. Their advanta-tional board of agriculture, have become active. The very complete education which these re-ges are becoming so self-evident, and the public laborers in the field of experiment; and by the ceive, under the eye, and in the house of the prin- attention is so awakened on the subject, as in all application of capital and science, have improved cipal, terminates with a course in the agricultuprobability to leave to this legislature only, the value of their estates from two to ten fold. The

First, to its agriculture. This school will collect the best systems, and most recent improvements in husbandry, from Europe and America; analyze them,—adapt them to our climate, our to the British parliament, upon the subject of education. The whole establishment, he says, comprises but 214 acres; and the average annual profit of the pattern farm alone, for a period of four years, he found to be 836 pounds sterling, or about \$4,000, exclusive of the cattle concern, which was kept separate. We are furnished, in Rees' Cyclopedia, with numerous statements, demonstrating the superiority of the new over the old system of husbandry; two or three of which shall be noticed in abstract. The first comparison is made on a mixed, or grazing, breeding and tillage farm, of 314 acres, in York. Under the old system, the net profits amounted to £318 10s. and under the new system, the same lands yielded a net profit of £596, making a difference of £278; or nearly 100 per cent. in favor of the new system of husbandry. The second favor of the latter—£322, or 250 per cent. A third statement exhibits the profits of an acre of

improvements which distinguish our day and country. The subject has been twice before the legislature of Pennsylvania—a favourable report has been made in the popular branch upon it, and the project postponed, but not abandoned. But Virginia has begun to act in earnest. The society of Albemarle county, with the late President Madison at its head, has appropriated \$1,000 of the manufacture of the project postponed and its benefits extended, by this school. A knowledge of the Madison at its head, has appropriated \$1,000 of the manufacture of the project postponed and its benefits extended, by this school. A knowledge of the morally, and by their practice.

Horticulture would disseminate a knowledge of them orally, and by their practice.

Horticulture would be improved, and its benefits extended, by this school. A knowledge of the project postponed in the project postponed, but not abandoned. But has been more bountiful to her soil; but because nature fits extended, by this school. A knowledge of them orally, and by their practice.

Horticulture would be improved, and its benefits extended, by this school. A knowledge of them orally, and by their practice.

Horticulture would disseminate a knowledge of them orally, and by their practice.

Why is provided the project postponed, but not abandoned. But has been more bountiful to her soil; but because fits extended, by this school. A knowledge of them orally, and by their practice.

Horticulture would be improved, and its benefits extended, by this school. A knowledge of them orally, and by their practice.

This loss of the best varieties of fruit, and of cultivarieties of the best varieties of fruit trees,—of the best varieties of rout, and of cultivarieties of r its funds towards endowing a professorship of ag-another, with equal natural advantages? This useful qualifications to almost every man in the siculture in the university of that state. They contrast cannot be wholly owing to indigence, or community, and administer to his professor wall to indolence, in the unsuccessful cultivator. It as to his comfort. cultural societies in the state, inviting their co-proceeds rather from the want of method—of Secondly. To proceeds rather from the want of method—of Secondly. To commerce and manufactures, knowledge. Knowlege is science—and science is the benefits of this school will be in the ratio of

It has been said, that agriculture is a trade, an art, or a science. That as a trade, it requires only the exercise of bodily power. That as an art, it employs the understanding and the judgment; and that as a science, it comprehends a knowledge of natural history, of chemistry, &c. so far as these are subservient to the improvement of husbandry. We have many who follow

The introduction and multiplication of improadopting salutary changes. In no instance, perhaps," he adds, "is habit more unyielding, or irrational practices more prevalent, than among those who cultivate the earth. And this is the more to be lamented, as agriculture is still so far below the attainments to which it may fairly as-below the attainment attainments as a substantial as-below the attainment attainment as a substantial as-below the attainment as a substantial as-be below the attainments to which it may fairly aspire."

profit of 1,800,000 pounds sterling, per annum, sobriety;—and a laudable ambition to excell, in a would result to Great Britain, if one half of the business, in which private gain is always public grain raised in the kingdom, should be threshed the many advantages which are likely to grow with the improved threshing mills. Mr. Burgess, whether of industry or of indolence,—of virtue in a late address to the Rhode Island society for the promotion of industry, enters into a calcula tion to show, that the general use of Wood's cast iron plough, would effect an annual saving, in that small state, of \$8,000. The faculty of this analyze them,—adapt them to our climate, our school would be competent to investigate the soils, our productions, and our wants;—demonstrate their utility in practice, and disseminate a knowledge of them into every part of the state. knowledge of them into every part of the state. The Hofwyl farm will serve to illustrate the extent of these advantages. Mr. Brougham visitions would inspect imposition and loss by those that it is a left of these advantages. ions would inspire confidence in those found to be cle around him; and the sphere of its influence found to be useless. Genius would thus be ented this in 1816, and inquired minutely into its found to be useless. Genius would thus be endetails. Two years afterwards, he spoke in high couraged, and imposture put down. An authoricommendation of it in a report which he made ty to grant honorary rewards, for inventions proved to be valuable, could not fail to facilitate improvement. A manufactory would afford models of the best machinery, to those who might want to buy, and serve as a school of instruction to the pupils, in the application of mechanics.

An experimental farm, of the operations of

ry. It is not enough to know what experiments prove successful. We need to be advised of those which prove unsuccessful, in order that we may avoid the errors which their results indicate. gree of perfection, or established on rational and unerring principles, unless by means of experiland, being the medium of several hundred acres, in Yorkshire, for six years, Under the old system, the profit was £1. 9s. 3d.—under the new, £17. 6s. 9d, an increased gain of more than 1100 the extension and at the expense of government, to bring the ment of an experimental farm, under the sanction and at the expense of government, to bring the extension and at the expense of government, to bring the extension and at the expense of government, to bring the extension and at the expense of government, to bring the extension and at the expense of government, to bring the extension and at the expense of government, to bring the extension and at the expense of government, to bring the extension and at the expense of government, to bring the extension and at the expense of government, the profit was £1. per cent. in favor of the latter. The medium profit of an acre in tillage, in England, is stated at from 27 to 36 dollars per annum.

We need not resort to Europe for evidence of quainted with the important facts developed by the disparity which exists between the old and the operations of this farm, through the medium sider the influence of a school of agriculture upsider the

the commonwealth at large, to aid by private subscriptions, restricting each to one dollar.—
Their plan very properly embraces a course of That has been said, that agriculture is a trade, and as the harvest is abundant and manufactures, the benefits of this school will be in the ratio of the increased products and profits of agriculture.

Commerce and manufactures prosper or languish.

It has been said, that agriculture is a trade, and as the harvest is abundant as the harvest is abundant. as the harvest is abundant or scanty. Take the husbandman from the soil, and they perish.—

Multiply his products and they thrive.

Thirdly. A school of agriculture will improve the morals of society. Industry is the best preventive of vice, and the surest promoter of virgentive of vice. tue. This school will promote industry, not only on account of the pecuniary rewards which it will hold out, but from the desire of honourable distinc-tion which it will cherish. The students will carry with them to their dispersed homes, constituor of vice, the more extensive its influence .-The greatest stimulus to study and application, which can be infused into the youthful bosom, is the hope of excelling. Here will be ample scope for its indulgence. If endowed with an ordinary capacity, this school will confer upon the pupil advantages which cannot fail to render him conspicuous in life. His example will operate as a stimulus to industry and improvement to the cirwill be constantly enlarging. By raising the character of agriculture, and classing it among the liberal and learned pursuits of life, we shall attract many to its shrine, and to habits of usefulness, who would otherwise eke out lives of in-dolence and vice. The professions are overstocked. Many who have been educated in them, are resorting to agriculture, illy qualified as they are, to make a subsistence. Others would follow their example, did not lethargy, false pride, or the want which, accurate details should be kept, would of knowledge or capital, interpose serious obstaturnish good tests of the value of grains, grasses, plants and animals, which may be introduced from abroad, or but partially known among us—riculture. Instead of being burdens to their riculture. Instead of being burdens to their would instruct us in their culture and manage-ment—and do much towards establishing general and salutary principles in the business of husband-families. That system of education has been bad, which has taught young men to expect a fortune, without instilling into them a single quality which can preserve or acquire one.

Fourthly. A school of agriculture will tend to

case is that of a tillage farm, of 139 acres, in Lindividuals who commit them, because they would colnshire. Under the old system, the profits were £130,—under the new £452—Difference in favor of the latter—£322, or 250 per cent. A gree of perfection, or outablished to published by the individuals who commit them, because they would consequent upon the extensive lines of our canals, augment the revenues of the state. The increase details upon the extensive lines of our canals, augment the revenues of the state. The increase of the products of culture can never be brought to its highest deagriculture, will in a few years remunerate the state. treasury, in the opinion of your committee, for every expense incident to the establishment, Our situation is singularly propitious in this respect, and holds out a prospect of indemnity which no other state possesses. The new wants which it will create for the salt and plaster of the

participate in the duties of office, as nearly as stitution shall demand. possible in the relative proportion of their numbers. The school which your committee profund, which your committee respectfully beg pose, would soon furnish a body of men, whose leave to suggest. There are several applications feelings, habits and interests would be purely for oank and insurance charters already on our

The plan and regulations of this school will properly fall within the province of the com- It is a fact of notoriety which has been blazoned this report, and these it will require time and deliberation to mature. It may not be improper, however, to state generally, that the course of studies contemplated, will embrace every to agriculture, and the practice of other countries and other states, -and that the labours of the pupils will extend to every department of practical husbandry, including gardening and the management of cattle. It will be desirable to fix the cent. above par; and that the stock of one of tuition so low, as to place the benefits of the the banks most recently incorporated, is sevenschool within the reach of youth of moderate re- teen per cent. above par ; or, that \$100 of the sources.

the establishment of an agricultural school, and of the course of instruction contemplated, it remains for your committee to suggest the ways and means by which this school is to be established and supported. A commendable economy ought always to govern in the appropriation of public money; but in public, as in private con-cerns, a reference to future indemnity, and ultimate gain, aught not to be lost sight of. Your committee, for the reasons already detailed, are induced to consider the appropriations requisite to this object, rather as a loan, than as a donation paid a bonus to the state of \$100,000, and a far -and as a loan too for which the state will re-ceive usurious interest. They possess no data to determine what funds will be requisite to support the stocks of new banks in our commercial capithis seminary. The Hofwyl school maintains it tal, are to bear a premium of ten or fifteen per self, and is a source of profit to its beneficent cent, the moment they are issued, is it unreasonproprietor. It may be proper to remark, that nothing of estentation or extravagance is con-templated. The buildings should display solidity, simplicity, neatness and taste; and, in re- national and state legislatures, as well as the prin-

These facts are derived from unofficial, though it was the wish of the committee, to have obtherefore liable to error, and probably are incorrect in stating some of the items too low.

The above abstract is not introduced to call in question the wisdom of the legislatures who made these appropriations, but to direct public attention to an important fact which it discloses, viz. not one dollar has gone in direct aid of agriculture, the great business of our state, the source of its wealth, and the foundation of its greatness. Of the one million two hundred and fifty-five thousand dollars, given to colleges and academies, the cultivators of the soil have derived but very little indirect benefit: For through these seminaries, lies the road to the professions,-not to the plough ;-to mental, not to bodily labour. Eightythree thousand one hundred dollars, have been appropriated exclusively to the medical department. Now that we have bestowed so much care and expense upon the timbs, your committee conceive it to be just and proper, that we should endeavour to infuse intelligence, vigour, and activity, into the body, that it may the better sustain and strengthen the members.

Your committee have prepared a bill in accordance with their views upon this subject, and have directed their chairman to ask for leave to present the same.

J. BUEL, Chairman.

its next session.

II. And be it further enacted, That the appropriations put at the disposal of the Board of Ag state, in the manner prescribed, and for the purposes intended by this and the aforesaid acts.

-0-AMERICAN GRAPE.

DEAR SIR,
Among the variety of useful and interesting matter with which the American Farmer abounds, the same kind of horses of his neighbours, but he I observe several articles commending the culture Col. Gibbs of this Island, advising attention to the culture of the grape of the United States; of which there are several varieties, particularly from the southern states. Whether those grapes be indigenous, exotic or hybrids, is not a matter of great moment, provided they can be easily propagated among us by cuttings; are hardy, heal-thy, and productive of good wine fruit.* Many

miles and repeat, carrying one hundred and forty pounds for aged horses, and giving a premium to Grapes, has occasioned some speculation, and the pense, without the leisure, patience or experience such winner, if he measures sixteen hands or pursuit of the enquiry may be useful to the histoabsolutely necessary, is it wise in us to neglect the fine English horse, almost perfected by the unbounded wealth of kings and nobles?

The Arab horse rarely more than fourteen and a half hands, and seldom that, is no doubt the source from which the greatest improvement has been made, but his descendants are now bred to sixteen and seventeen hands high, with great bone and muscle, perfect symmetry of form, and fine action.

Discard the blood horse of England, and select from all the world, and you would not in two has far as my own experience goes, I agree with Lawrence, that the blood horse of England is the best for every purpose; best for the chase, for

of the gardens and some of the fields in this vi-II presume it to be a variety, and have some reacinity, contain valuable grape vines, and the soil of this part of Long Island, seems to be well adapted to grape culture, it being a fine sandy loam. But inattention, business, or something else, prevents the proprietors or occupants obtaining the knowledge of the proper mode of culture, and many of them believe the culture to be tedious and difficult; now, the vine, especially of our country, is a hardy, productive plant, and its culture very simple and easy. A little attention and practice will prove the truth of this assertion. Close trimming in the fall, (Nov.) of the well formed wood of the current year, to within three to five eyes of the wood of the preceding year, and leaving no more shoots upon one vine than can be trained with ease the ensuing year, will hardly ever fail to give vigorous fruit shoots in the spring. It is not necessary here to state the whole process of this simple culture; the reader may refer to the very intelligent and useful detail on this subject, contained in Ao. 1. Vol. VI. page 66, of the Massachusetts Agricultural Repository and Journal-which I presume you will republish; those directions correspond in all material points with the practice which I have pursued for the last four years, except laying down the vines. I am indebted to Father John Abercromby's Practical Gardener, for my instruction, by following which, I have, for four years, succeeded in rearing an abundance of garden grapes; and have not, as yet, been troubled with fly or worm, though there were "more signs of them" last fall that in any preceding year; the vine runs upon a trellis. Upon experience, I do not find it necessary to "lay down" and cover my vines, and I am now in the third year of open culture, i. e. exposed to all weather, except the roots, which I surround closely in December, with rotten manure, placing about five bushels to the root of each vine, which manure I spread in the spring; the chief strength or salts of this manure are probably carried to the roots, by the wet and rain of the winter, when the weather is mild .-From the exposure mentioned, I have not found any diminution in the quantity or quality of the grapes, which are of fine, rich flavour, and the vine is the greatest bearer that I have seen in any part of our country. The bunches of fruit are compact, weigh from 1 to 1 lb.; the grapes are of a deep purple colour, oval shape, and have an unusually thin skin, for an American grape. I estimate the number of bunches on a double trellis of 30 yards length, at about one thousand per annum, i. e. that number were permitted to riannum, i. e. that number were permitted to ripen; nearly as many more were removed, in trimming and thinning. This grape was brought from Smithville, North Carolina, by Mr. G. Gibbs, of that state, and was reared by that gentlemen at this place, (Brooklyn,) with great care, under an impression that it was necessary to "lay it down and cover it" every winter. The same vine has been now three winter, and without injury; the last winter, and without injury in the last winter, and without injury; the last winter, and without injury in the last winter, and without injury in the last winter.

THE HAMPTON DAIRY—NEAR BALTIMORE.

We have been kindly permitted to take from the farm register the following account of sales to take from the farm register the following account of sales to take from the farm register the following account of sales winter, and without injury in the last winter.

We have been kindly permitted to take from the farm register the following account of sales winter, and the farm register the following account of sales winter, and the farm register the following account of sales winter, and th ters exposed, and without injury; the last winter, too, being unusually severe. Mr. Prince, of Flushing, has named this fruit the Vitis Isabella, in compliment to Mrs. Gibbs. I am informed that it has been botanically described under that name in some European publication, as a new species.

time of Louis XIV. the proprietor of the vineyard near Bordeaux, petitioned the King to prohibit the export of wine from Louisiana. The cause of this, was doubtless a belief that the Grape of Illinois was a good and abundant wine grape, and such as would injure the Bordeaux Wine

† I believe from the garden of Gen. B. Smith, at that place.

son to think it a hybrid of the Burgundy and Fox Grape. The vine from which it was taken at nues to be, I find all his receipts are not infallible; Smithville, N. Carolina, came from the vicinity of particularly that on ashes and salt, for cracks in Charleston, South Carolina, as is reported from stoves, as I find after drying, it crumbles off, and Dorchester. Some of the seeds of this grape were planted in my garden in 1818, and the young portion of Plaster of Paris with a little iron filplants reared with care-last October the first truits were taken, half a dozen small bunches, a justre of your eyes be preserved from the great and fine grape, not differing materially from the panoyance of smoke.

M. O. rent. The juice of this grape is abundant and luscious, and though I have not yet made wine from it, I have no doubt that it would afford a high flavoured and rich wine. The plant has always proved to be a very vigorous grower; the fruit ripens from 5th Sept. to 25th October; I have kept ripe bunches hanging in the open air of a dry, cold room, until December.

Your respectful humble servant, I. G. SWIFT.

Brooklyn, Long Island, 20th Jan. 1823.

‡ Many of the settlers of Charleston, and its vicinity, it will be remembered, were Hugonots.

THE FARMER.

BALTIMORE, FRIDAY, JANUARY 24, 1823.

We publish with great pleasure the ob. servations of a new subscriber and correspondent, on the AMERICAN GRAPE, and would fain cherish the hope of frequent contributions, from the pen of a gentleman so well known to his country, as one of scientific and general information. There are few subjects more interesting in their nature, or more important, than inquiries and experiments respecting our native grapes-their susceptibility of improvement by culture-their excellence as a table fruit, and their capacity to yield a generous wine-

To those who would turn their attention to these objects, we might venture to say that the volumes of the American Farmer contain already, more in explanation of the subject, than is to be found in the aggregate of all other American works, and yet there remains abundant room for enquiry and illustration, by new and interesting views of it, as will be seen in our subsequent numbers. In this as in many other cases of equal interest to the nation, it may be remarked that this journal has served as a kind of national speak. ing trumpet, whereby attentive observers in every state and climate have compared notes, and interchanged opinions.

Pegetables and Herbs.

210. CELERY.—The qualities of this plant are universally known. There are three or four sorts. The white, the red, the hollow, and the paid. The hollow white is the best; but the pagation and cultivation of all are the same. The white, the red, the hollow, and the ground, is not a bit too long for the getting of fine Celery. The seed, sown the cold ground, in April, will lie six weeks before it come up. A wheel-barrow full of hot dug, put in a hole in the ground against a wall, or any fence, facing the south, and covered with ard yellow. It is not to from any family. As soon as the plants are three inches high, and it scarcely matters how thick they stand, make a nice little bed in open free air; and, and wake a nice little bed in open free air; and, and wake a nice little bed in open free air; and, and wake a nice little bed in open free air; and, the red feel long, and they should be gently watered once, and shaded 2 days.

be coldered the red for the red for the last and the earth of the red for the pinks and the plants have got two red with careful for the pinks and the plants have got two red with little bed in open free air; and, wake a nice little bed in open free air; small, that this must be carefully done; and they should be gently watered once, and shaded 2 days.

The AMERICAN FARMER.—Baltimone g into the middle of the intervals for the earth hat you toke might be avorking backwards, night with a bit of carpet, or sail cloth, having out of the red water at this is the care arthing after earthing after earthing, fore the plants show the care in the earth against the into a little flower pot, and it is the red water and the the earth upon the carthing out of the level of the land. Then middle, till, at last the pots may be plunged in the earth upon the the plants alway to the care the plant save got we have of the plants are pot one of the Plats, each containing 168 plants. In prove, the plants are pot the middle of the intervals for the earthi ed, and shaded with a bough for one day. That will be enough .- I have one observation to make upon the cultivation of cucumbers, melons of all sorts, and of all the pumpkin and squash tribe; and that is, that it is a great error to sow them too thick. One plant in a hill is enough; and I would put two into a pot, merely as a bar against trenches a foot deep and a foot wide, and put plant, in spring, out of the ridge left in the gar-them not less than five feet asunder. The den. Plant it in an open place, and you will have than two (if standing near each other,) two more ground that you make the trenches in should not seed enough to serve a whole township. For sout than three, and so on, till you come to fifty in a be fresh dug; but be in a solid state, which very the seed brussed is as good as the plant itself.—
have gone off. Lay the earth that you take out in the middle of the space between the trenches, so that it may not be washed into them by the heavy rains; for it will, in such case, cover the heavy rains; for it will, in such case, cover the heavy rains; for it will, in such case, cover the heavy from the plant, and will go very nearly to destroy them.—When you have made your trench, put along it some good rich compost material, put along it some good rich compost material, put along it some good rich compost material, and will not keep nearly so long or so well.—Dig this manure in, and break all the earth very fine is sufficient for a garden. This plant has offsets to it, coming up by the side of the main stem. Pull all these off, and leave only the single stem. Cut the leaves off so as to keep the whole plant about six inches long.—Plant them, six inches apart, and fix them, in the real much of the plant that some persons use in soup persons use in fix manual plant that some persons use in latter that he sail the series of the plant that soffsets to it, coming up by the side of the single stem. Cut the leaves off so as to keep the whole plant about six inches long.—Plant them, six inches apart, and fix them, in the series are good as the plant that some persons use in sug good as a good as the plant that some persons use in stage of as good as the plant that some persons use in stage of a stage of the number of years that the seed will keep dearly sor which all the seed brussed is a good as the sall the seed will keep dearly sol that the seed will keep dearly sol that the seed will keep dearly sol of the plant and the septiment, and the will find this observation mathematically true.—When could the will find this observation mathematically true.—When could have not fruit at all! Let any one make the experiment, and hell the seed will keep dearly on the will find this observation mathematically true.—When could square foot; and then you will have no fruit at care, that nothing of the melon, pumpkin or squash kind grow near a seed-bearing cucumber plant; and that all cucumbers of a different sort from that bearing the seed be kept at a great distance.—There are many sorts of cucumbers; the Long Prickly, the Short Prickly, the Cluster,

and many others; but, the propagation and cultivation of all the sorts are the same.

218. DANDELION.—This is a well-known and most wicked garden weed, in this country as that heat beneath to cause its roots to strike out tity, in the salad-season, should be sown every six almost instantly. When the plants begin to grow, which they quickly will do, hoe on each side and which they quickly will do, hoe on each side and which they quickly will do, hoe on each side and they are of a hot-bed, made for radishes or cabbage-plants.

This salad-season, should be sown every six and most wicked garden weed, in this country as well as in England; and I am half afraid to speak of using it as food, lest I should encourage laziners of a hot-bed, made for radishes or cabbage-plants.

The salad-season, should be sown every six and most wicked garden weed, in this country as well as in England; and I am half afraid to speak of using it as food, lest I should encourage laziness. But, there may be people without gardens, and to them what I am about to save

I have been led, gentlemen, into these remarks chiefly to pave the way for a suggestion, which have mounted over their heads into the favour I will now take the liberty of making from a thorough conviction of its great importance and injury and gross injustice. They too have indulgits invaluable utility. I most seriously recommend to this society the formation of a library for the exclusive use of its own members, to be example set them by the commercial and manumade up of such publications, as relate to every facturing interest, by embodying themselves, branch of rural economy: of these there are and as a distinct, separate interest have addressabundance, of modern production and of intrinsic ed the government in language manly, independence and worth; well calculated to instruct, dent and disinterested. "We ask you" say they, to improve, and amply to repay the expense of procuring, as well as the trouble of reading .-The establishment of such institutions have been sanctioned, and their utility fairly tested, by the examples and practice of nations, communities, and societies, in all times and in all countries, since the invention of the art of printing. Like the circulating system of the blood, which carries life and vigour and health to every part of the animal, these great arteries of science diffuse knowledge and improvement and civilization throughout the remotest extremities of the social

These very imperfect and crude remarks, gentlemen, in which I have attempted to address your understandings, upon the importance of a know ledge of the principles and the necessity of a rational improvement of agriculture, belong to one branch only, of our business as a society. From the example which has been regularly given by the Delegation, to the united societies, at their sessions, we are led to consider the protection of the rights of agriculture in a political sense, as forming another branch of our business, when "prescriptions of a definite and specified power, ed under the title of a republic, or of an aristoresembled; nor am I at all disposed to detract "not by the unwarranted inferences of a loose cracy, or of a monarchy. The effects will always assembled; nor am I at all disposed to detract "not by the unwarranted inferences of a loose cracy, or of a monarchy. The characteristic importance of this branch "construction of general phrases. Give to all be the same, if the causes are of the same nature,

which we have grown to renown, to wealth, to what way it has happened that all other interests country, nurtured and cherished in the lap "of rural occcupation: From their bosoms the republican spirit was transfused into our political institutions. Monopoly, privileged or-"ders, chartered rights were the bane of that "government from which we seceded. We "threw it off on account of the mischiefs pro "duced by that course of policy in the mother "country. Our government was made by the "whole for the whole, and no exclusive privi lege can be conferred, but as a reward of services rendered to the public. Let us all alone. We demand only protection in our persons and in our property—leave private, individual enference of government, in the form of restric-

government, by adopting a system of general policy: not by local, partial legislation for a particular interest, with the false, insidious pretence that all may indirectly come in for a share of the benefit. It is to this latter principle we trace that policy which in all ages has led to the establishment of despotic government, and from the practical operations of which, particularly in the hierarchical institu-tions of England, we were driven into successful opposition to that power."

With sentiments like these, addressed to the

The great mischiefs attendant upon all the governments that have ever existed, have arisen same process we detect the qualities and ingretions of the earth: a policy which would drive from an officious meddling disposition in those dients which constitute manures, and in that way this nation from a course of measures pointed out who govern, to regulate every thing in society. adapt them to the purposes of improving the soils. to her by the unerring hand of Nature, which This, however, should not be considered extraor-has stamped upon our geographical chart in in-dinary in those governments, which were made The science of Botany presents to our view the has stamped upon our geographical chart in in-dinary in those governments, which were made history of the nature and organization of vege-delible characters, "that agriculture and com-exclusively for the benefit of the few privileged "merce should be the principal occupations of orders: because without such universal and con"our people." This foul spirit of monopoly, of stant superintendance and regulation they could to produce their highest perfection. None can local and partial legislation, so frequently and so not wield and manage the machinery to the purdoubt the importance and value of this kind of fatally insinuating itself into our legislatures, poses intended by its formation. Hence has knowlege to those engaged in agricultural oc-cupations. The modern improved construction courage domestic manufactures, or of privileged power, not only to regulate the high and important concerns of conscience in the form of esof husbandry, together with the construction of tion, remains to be exorcised from its unhallowed tablishments of religion and test acts; but also, some entirely new ones, has done perhaps more hold upon our institutions by the all-pervading the more insignificant and petty concerns of pritan any other occurrences of modern times, not and all-controlling influence of public opinion.— vate domestic economy. But in the United States. where we have proceeded upon a belief that man is competent to self-government, it would be naculture: And for these we are indebted, in a ed, has already begun the work of reformation in tural to suppose that political power should abgreat degree, to a knowledge of the principles of this behalf. The agricultural interest throughout stain from all interference with the affairs of somechanical science. stain from all interference with the affairs of sorental power of protecting the weak against the strong, and restraining and coercing the vicious, and patronage of Government, to their manifest the refractory and the violent, at the same time allowing all to pursue their own happiness in their ed the feelings and obeyed the impulses of the own way, strictly regarding the rights of their "Esprit de Corps." They have followed the neighbours. Whatever political measure shall detract either from the profits or the respetability of any avocation in society, must necessarily do it an injury, nor is it less true that whenever government shall lend its fostering aid to any dent and disinterested. "We ask you" say they, particular branch of industry, it will thereby for no favor, no exclusive privilege, no charter give it an impulse which may force it ahead of of incorporation. We call to your recollection others, not so favoured. For many centuries the instruments by which our independence preceding the revolution in France, the royal was achieved. It was the yeomanry of the favour and patronage were exclusively bestowed upon the church and the army; and by amalga-mating these two interests with the hereditary nobility of the country, it was not surprising that all honour as well as emolument attached exclusively to them. The consequence was that agriculture, commerce and manufactures being viewed and treated merely as subservient and auxiliary to the promotion and aggrandisement of these other leading interests, became disreputable and unprofitable, and were pursued exclusively by those only, who in the fashionable slang of the times were termed the ignoble, the vulgar, the rabble, &c. The history of other governments in Europe, which like France, have had a feudal "terprize to its own guidance and direction, origin, would furnish instances equally apposite equally untrammelled by the officious interto our purpose, which is to shew the all-pervad-ing influence of political power in directing the tion or of a pretended fostering care. Pursue destinies of man in this world. Nor is it impor-your legislative career, under the constitutional tant, as to results, whether such power is exercisof our proceedings, or to indulge any apprehen-" an equal participation in the blessings of a free it matters not as to results whether the great

EXTRACTS FROM THE ARCHIVES OF USEFUL KNOWLEDGE.

An account of the growth, and processes of Mealing, Malting, and Brewing of the Northern Naked Barley *-By R. FLOWER, Esq. Marden, near Hertford, April 1, 1810.

GENTLEMEN,

When I had the honour of being present at a meeting of your Society in February 1809, amongst the many subjects then discussed, were the qualities and merits of the Northern naked Barley.

As no accurate statement was brought before you of any experiment by which its value could be ascertained, I beg leave to recommend to your attention the following account of the growth and processes of Mealing, Malting, and Brewing of the Northern naked Barley.

On the 12th of May, 1809, I sowed five acres of it after a mixed crop of turnips and cabbages, which were fed off by sheep in the latter end of April and the first week in May. This crop being very abundant, kept the sheep longer on the ground, which was on this account in some degree better manured than any other land.

Although this barley was so late sown, it was ready to cut a week sooner than my English ing, and brewing. barley, and came to maturity a month sooner, which is doubtless an advantage to the husbandman, as the crop of barley on the latest-fed tur

nip land often suffers.

Of the produce I can only speak comparative ly, as it was not large; a long drought in the summer burnt our light-land crops, and this suffered with the rest. I had two quarters; of English barley per acre; of the naked four quar ters, one bushel. t It came up well, and had a luxuriant appearance during the dry season.

I sent a bushel of each sort of barley to a

ciety, vol. xii. p. 169, Bath, 1810.

labouring interest is ground to dust by the opera-neighbouring mill, requesting each might be

English—Flour 1 10 or Pecks. lbs. lbs. 65 Bran 1

the mill.

Each bushel of barley lost 4 lbs. in the process bushel, than the English, which is within 2 lbs. Whilst then, gentlemen, as a society, we keep of seven pecks per quarter, (of 8 bushels); and at steadily in view the important subject of agricultute computed value of 2s. 6d. (55 cents) per of seven pecks per quarter, (of 8 bushels); and at 8 bushels) than was obtained from English bar-

> In the course of the winter I malted six quarters, equal to our usual steeping of twenty quar ters. I had also a large increase in the mak-

ardson's Saccharometer) confirmed my observa pare for five or six cutters. tion, having extracted 12 lbs. more of saccharine matter, per quarter, than from the English malt.

The result of these different experiments appears to be in favour of the Northern naked Barley as follows:

Nearly seven pecks of flour, s. per quarter, more than obtained from English barley, at 2s. 6d. or about 55

cents per peck, Or in its malted state, 12 lbs. more of saccharine matter, per quarter, extracted than

from English malt, at 1s.6d. or about 33 cents per lb., 18

3

From this account it may be fairly presumed, carmine. that the northern naked Barley is worth from 17s. or \$3 78 cts. to 18s or \$4, more, per quarter, than the English, for the purposes of mealing, malt-

> I remain your obedient servant, RICHARD FLOWER.

REMARKS. Mr. Vancover confirms the fact of naked bary ripening well, but adds that the grains must not be ground, but only cracked.

A naked barley was introduced into Philadelhia a few years since, which yielded well, but pon the supposition that it would not malt, it as been but little cultivated of late. The foreoing accurate statement, however, not only illy proves the incorrectness of the opinion, but emonstrates the superiority of the naked barley or the purpose. - Editor of the Archives, &c.

TO MAKE CIDER OIL.

This liquor is a very favourite drink with a The following receipt has been communicated to the Editor, by a person well acquainted with the mode of compounding the liquor

The cider must be well racked two or three times in clear weather. Four gallons of best ap-ple-brandy are then to be added to each barrel of cider, if the cider be weak, but if it be strong, less will suffice. An infusion of Sassafras root, made by putting a piece of about the size of a finger, and chipped fine into a pint of water, improves the flavour. The barrel is then to be rolled.

In years when apples are abundant, cider even Total 44 when returned from of a good quality brings only a small price; but by converting it into cider oil, it may be preserved until the following spring, and will then

TO DRY PEACHES.

The following mode of drying peaches is adopted by Thomas Belanjee, of Egg-Harbour, New

He has a small house with a stove in it, and drawers in the sides of the house, lathed at their bottoms. Each drawer will hold nearly half a bushel of peaches, which should be ripe, and not peeled, but cut in two and laid on the laths consider as the defect of almost all the barley of with their skins downwards so as to save the juice. On shoving the drawer in they are soon dried by the hot air of the stove and laid up .-Peaches thus dried are clear from fly-dirt, excel-lently flavoured, and command a high price in ing, having nearly two bushels in six quarters, market. Pears thus dried eat like raisins. With which is much more than it is usual to obtain a paring machine, which may be had for a dolfrom the best barley on our plan of making malt. lar or two, apples or pears may be pared, and On brewing this malt, I had the satisfaction to sufficient quantity dried, to keep a family in find the wort tasted much richer than that brewed pies, and apple bread and milk, till apples come from my English malt. ON MIXING COLOURS FOR PAINTING.

To make Gum Water. Dissolve gum Arabic in clear water to the consistence of sweet oil, and if too thick, reduce it by adding more water, and shaking it well together. Keep this in a phial for use. The different colours wanted, may be produced by the following mixtures, or substances:

A deep Scarlet. Mix red lead, vermillion, and

A light Scarlet. The best red lead only.

A light transparent Crimson. Carmine only.

A deep Crimson. Carmine and fine lake.

A deep Purple. Prussian blue and carmine.

A transparent Purple. Logwood steeped in

water, and shaded with the above.

A full Rose Pink. Carmine and white flake. An Orange colour. Red lead and gamboge. A deeft Brown. Burnt amber.

A light Brown. French berries and light ochre.

A deep Blue. Indigo and Prussian blue-shade with the former.

A light Blue. Verditer, or white flake and

Prussian blue.

A transparent Blue. Prussian blue reduced to a wash.

A deep yellow. Dutch pink, or king's yellow. A light or dark yellow. Gamboge alone, according to its thickness, will give every tint, from the lightest to the deepest.

^{*} From the Letters and Papers of the Bath So-

^{† 16} Bushels.

[‡] Mr. Flower has since informed the secretary that the beer proves excellent.

A light Green. Sap green and verdigris.

A Pea-Green. with flake white.

A lively transparent Green. Verdigris mixed with sap green.

A deith Green. Gamboge mixed with indigo. Afull Straw Colour. Flake white and king's vellow.

A transparent Black. Indian ink only.
A full Black. Ivory black only.

A white for shading. Sap green, Indian ink, and indigo very thin.

4 common White. White flake only.

To make the colours work freely, mix them with a small quantity of fish gall. Should the alum water, or thin starch.

Mechanics' Gazette.

DOG AGRICULTURAL SCHOOLS.

In our last number, we had the pleasure to present to our readers the very interesting Report, recently made by a committee, to the Legislature of New York, upon the important proposition to establish an Agricultural School in that State.

The merits of the plan are so clearly unfolded by the Committee, in their Report; that we felt no inclination to add a single reflection to itmuch, and ardently as we wish, to see their views

approved and successful.

We had received previous, but private intimations of this noble design, and had placed the following letter on file for publication: we now insert it, because it furnishes acceptable details, and gives us the opportunity to bear our humble testimony, to the useful and persevering labours of an early and zealous advocate of Agricultural, and Internal Improvements.

Editor Am. Farmer.

Albany, 26th December, 1822.

DEAR SIR,

The multiplication of Agricultural Societies, and the progress of agricultural improvements in the United States, offer the highest gratifica-

tions to feelings of patriotism.

This excitement, which now pervades the whole country, has given rise at different periods to the most useful suggestions in several States.— A national Board of Agriculture was first suggested by the great Washington to Congress in 1796. And subsequently, pattern farms were recommended by such patriots as Judge Peters and Dr. Mease, of the Philadelphia Agricultural Society. The formation of a State Board of Agriculture was afterwards urged with great zeal and success in the State of New York, so that we may at least claim the honour of first instituting a Board of Agriculture in America: under the sanction of a law passed in 1819. But thus far, I fear the Board has been of little practical utility, and for reasons too delicate perhaps to be unfolded at the present day. Although attended with considerable expense, it has not fulfilled the public expectation-as it has not created any new excitement. On the contrary, several societies in this State have been abandoned; viz., Cayuga, Chenango, &c. Its efforts have only resulted in the publication of an annual volume, in precise accordance with the old practice of the Massachusetts and Pennsylvania Societies, under a system which never could produce any general effect. The institution must however be considered as in a train of experiment; and although slow and heavy in its present operations, it may and no doubt will, under a new organization, and in connexion with a pattern farm, be roused from its slumbers, proceed with more animation, and produce the important consequences, that were ori-ginally expected from it. It is with pleasure, your next number, the reply of Mr. Smythies.—

amine and locate a suitable situation. None how-There is a command of sufficient water for affords a beautiful view of this City and the Hudthe Albany County Agricultural Society, will en title him to the gratitude and respect of the community, and consign his fair fame to posterity .among the nations of the world. As highly as I prize the important effects, which will result from extensive and more general benefit-considered in all its bearings; and especially, by the educa-county, Virginia. tion of 400 young men yearly-qualifying them establishment, which should be, to prepare them ness, that is to be their future employment. In a word, to make them by education, labour and experience good practical and scientific farmers .-Thus in the process of a few years our whole system of agriculture will be advanced by knowledge and harmonize with the truths of science.

In subsequent communications the objects and progress of this important institution will be fully

explained.

Respectfully, ELKANAH WATSON.

JOHN S. SKINNER, ESQ.

Editorial Correspondence.

VALUABLE CATTLE FOR SALE. Rule by which to ascertain the weight of Live-Stock from measurement.

FAUQUIER COUNTY, Jan. 13, 1823. Sir,-I lately read in your paper, No. 39 of vol. 4th, a letter on the relative merits of the Short Horn and Herefordshire Cattle, and was almost induced to believe that the cattle called Herefords, in that letter, were certainly a different race from those very valuable cattle imported in 1817, from England, by the Hon. H. Clay, of Kentucky, as the Herefordshire-reds; but my

Sir, I add, that the formation of a Pattern Farm You mention in your preface to the publication Verdigris or sap green mixed in the vicinity of this city, is now agitated by in fluential men, with increased zeal This zeal has identical breeds now in our country, in the hands been prompted by the magnanimous offer of the of" certain gentlemen of different states, amongst Hon. Stephen Van Rensselaer, to give a farm them Mr. Clay, of Kentucky, is named, and that of 200 acres, near this city, well adapted to the their offspring would soon be for sale. I purobject. In pursuance of which on the 18th inst. Mr. chased last summer in Kentucky some of the breed Jesse Buel and myself, accompanied by Generals of Mr. Clay, which I am very partial to, and Van Rensselaer and Dunbar, left this city to ex- did not intend to offer them for sale, but since I read these publications in your paper, I am ever has yet been found to unite so many requisites as the Cantonment at Green Bush, belonging to the United States, containing 250 acres of to replace them again. It is needless for me to land, on which there are a great variety of build-ings well adapted to the purpose. The soil is va-tleman disposed to purchase, will make himself paper shrink, wash the back of the print with rious, and the surface is diversified with hill and acquainted with their merits and view the cattle. I would only refer to the letter of Mr. irrigating experiments—it binds on the turnpike Clay, published in your paper, No. 28 of the 4th road leading to Boston, lies high, is healthy, and volume, and the letter of Mr. Pickering, published in No. 23, of the third volume. Of this breed son River. Several of the buildings may be made I have a very fine cow, five years old next sumpermanent, others would answer for the tempo- mer, of a good size, a very handsome and delirary accommodation of Agricultural students and cate head and neck, pretty complete in all the for other purposes. This noble and magnanimous points; of a beautiful blood red colour except, the offer of Mr. Van Rensselaer, in connexion with face, under the breast, belly, &c. which are white. his annual donation of Five Hundred Dollars, to She is a good milker, and is now 4 months in calf, by her son Comet, a fine and noble young animal, two years old last July, of the same colour, &c. of his mother, and nearly five feet or fifteen Should his example be followed by men of great hands high, well proportioned. Comet is a cross wealth in other states, the practices of Agricul of the Herefordshire and Teeswater; he was ture, throughout our happy country, will soon be got by Col. Crockett's celebrated Teeswater governed by rules of art, founded upon the truths Bull, that came out of one of Capt. Smith's imof science, and give us a commanding stand ported Heifers, and, it is said, he was got in England by a brother to the famous Bull Comet, that sold there for 1000 guineas. Mr. Clay, in a our stupendous canals, I really believe that if this letter to me relative to these cattle, states, that pattern farm should be well endowed, well organihe sold the above cow when a yearling, for \$200 zed, and well administered, by men of competent talents and business habits, it would in the time, I will take for Comet and his mother, five range of 25 years, be found to produce far more hundred dellars. TO PRESERVE BACON SOUND AND SWEET THROUGH THE SUMMER.

Dear Sir,-In the Farmer, volume 3, page 309, you published a communication from Mr. J. W. Lincoln, of Worcester, recommending, that hams, after being smoked should be packed away in oats. I followed his advice last year, and really feel so much indebted to him for the hint, that I must thus publickly thank him; and for the benefit of my neighbours ask you to re-publish his letter. To give you the best proof of the beau-I send you a ham weighing 113 pounds, you will find it perfectly fresh, and full of essence—free from all sort of speck or blemish. Those practising this mode of preserving their bacon free from skippers or taint of any kind, should recollect, that the chest or cask, ought to be perfectly tight, and raised about six inches from the ground,

We can seldom undertake to speak from experience about recipes, but in this case we can the cream, which invariably injures the butter vouch for its accuracy, from reliance both on the by rendering it white and insipid. word and the judgment of both the writers. But it must not be expected that the oats will convert of making butter, and at the same time to imthis will preserve it in statu quo.

>0< SWEET BUTTER.

The component parts of milk are oil, curd and whey. The oily parts constitute the cream, and tiful state of preservation secured by this method, the curd makes the cheese. The oily parts, being specifically lighter than the other parts of the substance, ascend to the surface in the form of cream.

In winter, four of five days, according to the common practice, are necessary to produce all the cream of a pan of milk. Such cream from this tedious process not unfrequently acquires a and the oats packed in, quite tight. A ham of bitter taste, which is communicated to the butter. this size should be boiled 3½ hours at least.

And the churning of butter from such cream is moreover an operation of four or five hours, and sometimes longer, unless hot water be poured into

To shorten the time and to diminish the labour bad bacon into good; all that is promised is that prove its quality, there has been recently established in the Dairy-House of Mr. Ro. Smith's Farm, called Orange, an apparatus upon the simplest principles imaginable. During the cold-If your friend Isaac Sharpless* will stack or from the cows, sweet cream is produced, greater dred and twenty-three. wanted for use run it through the fan and blow five minutes. The butter from such cream has never failed to be of a fine flavour and of a fine colour; and in the nature of things it never can fail to be so, unless the dairy woman should be utterly ignorant of the art of making sweet butter. The process is not a new invention. According to the principles of the system pursued at Orange, is made the sweet butter which, in England, is the most admired. The part of the course of proceeding, not in commor. use is this:few hours, then run it through your fan, with a The pans, with the milk just taken from the cows, coarse riddle. THE FARMER.

BALTIMORE, FRIDAY, FEBRUARY 7, 1823.

NAKED BARLEY.

Particular attention is due to a short article in this number, which gives "An account of the growth and progress of mealing, malting and brewing of Northern Naked Barley"—extracted from Dr. Mease's "Archives of useful Knowledge."

Our attention was first drawn to this grain, by a letter from Capt. Henry Hall, of Harford county, accompanied by specimens of the Barley, and of its meal and flour-the first he considered excellent horse-feed, and of the latter he had made good unleavened bread-which gave rise to a favourble estimate of its value, that will be more than confirmed by the very particular experi-ments detailed in the "Account" now published. Our own trials of the naked barley have, however, been but very limited-they have not disclosed chalybeate water, and has ever been remarkably any difference in the straw or in the measure of the grain; but as a bushel of this yields more pure meal than the common barley does, and as acres, 240 of which are well covered with white a greater quantity of saccharine matter can of oak and pine Timber. The buildings are subcourse be obtained from it when malted, the Naked Barley is certainly entitled to the consideration of our farmers; and those who may wish to procure some for sowing the ensuing spring, will have an opportunity to do so this weih, when Capt. Hall will send some bushels to Baltimore for sale.

That the nett profits of most objects upon which agricultural labour is bestowed, are now much less than formerly, is but too true; but is it equally certain that we cannot find new objects that might be more profitably raised? It must naturally happen in the fluctuations of supply and demand, that articles which have for a long time afforded a living profit, will take a turn, and for a series of years bring the cultivator of them in debt. And is not this the melancholy prospect of persons, who now persist in the cul-ture of low priced tobacco? Would they not display better judgment by adapting their practices to the change of circumstances ?-but how can they do this, if they never inquire, read and investigate?-or if they will not become familiar with the various products of the earth, as respects their nature, value and adaptation to various soils and climates?

It is a curious fact, that the cultivation of certain articles is restricted, as if by a prescription little less operative than legal enactments, to particular districts and counties. Thus we see that in our tobacco counties this plant is still raised otherwise, and I am well satisfied, by the past, that a liberal public will justly appreciate and for sale at \$2 per hundred, by the owners of rich that a liberal public will justly appreciate and river bottoms and swamp lands, who never raised suitably reward the manufacturer of good, subfor the market a single hog, bullock, fine coach stantial machines. Every part that experience horse, or ton of hay, and who never having sown has shown to be weak, has been so altered as to horse, or ton of hay, and who never having sown a grain of barley, appear to think that this crop become perfectly strong; and long continued tri-has been given by Heaven as an exclusive boon als, seem now to prove that, in every part, they to Gloucester county in Virginia.

Valuable Property for sale.

I will offer at public sale, on Friday, the 14th of March next, at Bowling's Tavern, in Upper Marlborough, between 30 and 40 valuable SER-VANTS, consisting of young men, women and children, among them some excellent house servants. They will be sold only to persons residing in this state or the District of Columbia, and who purchase with a bona fide intention of keeping them for their own use-from strangers I shall require satisfactory assurance, that they will be treated with kindness and humanity.

At the same time, I shall offer for sale about six hundred acres of Land, being part of the Estate on which I reside-175 acres of good These machines have now been fully tested and Woodland, will form a part of the quantity sold, found to be efficient and durable. Upon farms and the whole will make a very desirable farm or plantation.

The terms for both the real and personal property above mentioned, will be made known on on the day of sale, and in the mean time I shall be glad to shew the land to any one who may desire to purchase it.

RD. W. WEST.

Woodyard, Prince Georges' County, Md. Jan. 15th, 1823.

Alderney Bull For Sale.

He is 2 years old, from an imported Cow of unusually good form, mouse colored, price \$100; the owner having two bulls, wishes to sell one. Enquire of the Editor of the American Farmer.

Red Clover Seed, &c.

Red Clover, \$8—Timothy, \$5—Orchard Grass, \$3—and Herds' Grass, \$3—all of excellent quality, received and for sale by the subscriber.

> ELY BALDERSTON. No. 61, Smith's Wharf.

AGENTS FOR THE AMERICAN FARMER.

Complete sets of the first, second and third vols. of the "AMERICAN FARMER," new and corrected Editions, can be had of the following persons; price of which, bound, \$5 per vol. or \$4 in Sheets :-

M. CAREY & SONS and E. LITTELL, Philadelphia.

W. A. COLMAN, New-York. WELLS & LILLEY, Boston. WM. F. GRAY, Fredericksburg. PETER COTTOM, Richmond, Va. RICHARD COTTOM, Petersburg. E. THAYER, Charleston, S. C. JOSEPH GALES, Roleigh, N. C.

W. F. REDDING, special agent, now journeying through the Southern States.

The fourth volume, now publishing, can be forwarded to any part of the United States, on application being made, by letter or otherwise, to

J. S. SKINNER, Baltimore.

Printed every Friday at \$24 per annum, for JOHN S. SKINNER Editor, by JOSEPH ROBINSON, at the North West corner of Market and Belvidere streets, Bathaner; where every description of shook and Joh Printing is executed with nearness and despatch—Orders from a distance for Printing or Binding, with proper directions promptly attended to, addressed to J. Robinson, Bultimore.

CHAPTER IV.

Vegetables and Herbs.

HORSE-RADISH .- Like every other plant, this bears seed; but it is best propagated by cutting bits of roots into lengths of two inches and putting them, spring or fall, into the ground about a foot deep, with a setting stick. They will find their way up the first year; and the second they will be fine large roots, if the ground be trenched deeply and made pretty good. Half duce enough for a family that eats roast-beef every day of their lives. You must take care that the Horse-radish roots do not spread, and that bits of them be not flung about the ground; for, when once in, no tillage will get them out. They must be, like the Dock and Dandelion roots, absoluteby burnt by fire, or by a sun that will reduce obstacles are, the complete impossibility of pre-them to a state of a dry stick; or must be taken up and carried away from the spot. Though a ground during the winter; and the great heat, flower out of their sockets; lay them on paper to them to a state of a dry stick; or must be taken up and carried away from the spot. Though a very valuable and wholesome article of diet, it is a most pernicious weed.

226. HYSSOP is a sort of shrub, the flowerspikes of which are used, fresh or dried, for medicinal purposes. It is propagated from seed,

plant bears at the root, like a potato, which to plant bears at the root, like a potato, which to the great degradation of many of the human see under Endive) and may be sowed at the see under Endive at the see under Endive. Of the former the sorts are endless, and, indeed, of the latter also. Some of both tribes tato, has, at any rate, the merit of giving no the heart, a slimy feel in the mouth; and are trouble either in the propagation or the cultivation. A handful of the bits of its fruit, or even to make the former than the fine country, the merit of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of its fruit, or even to meet a function of the bits of the former the some time of the bits of the bits of its fruit, or even to meet a function of the bits of the bits of its fruit, or even to meet a function of the bits of the bits of the former the some time of the bits of the bits of the bits of the bits of the former the some time of the bits of the b of its roots, flung about a piece of ground of any to mention, green-coss and white-coss, the former ground, no distinction is made as to earliness, or sort, will keep bearing forever, in spite of grass of which is of a darker green than the latter, is lateness in sorts; and, in other respects, some and of weeds; the difficulty being, not to get it rather hardier and not quite so good. These like one sort best, and some another. Amongst to grow, but to get the ground free from it, when when true to their kind and in a proper situation, the Musk melons the Citron is, according to my once it has taken to growing. It is a very poor, rise up, and fold in their leaves to a solid loaf, taste, the finest by far; and the finest Water insipid vegetable; but, if you wish to have it, now like a sugar loaf cabbage, and, in rich land, with melons that I have ever tasted were raised from and then, the best way is to keep it out of the gargood management they will become nearly as seed that came out of melons grown in Georgia

known shrub of uses equally well known. Hun-unless they be French, and, then you must have plies to melons as well as to cucumbers. To have dreds of acres are cultivated in England for the a lettuce to every person. Every body knows melons a month earlier than the natural ground flowers to be used in distillation. It may be pro- how to sow lettuce-seed along a drill, in the sowings will produce them is an object of much pagated from seed; but is easiest propagated from spring, to let the plants stand as thick as grass, greater importance than to have cucumbers so slips, taken off in the spring, and planted in good and to cut it along with a knife, and gather it much earlier; and, to accomplish that object, moist ground in the shade. When planted out it up by handfuls. But, this is not lettuce. It is should be in rows three feet apart and two feet herbage, and really fit only for pigs and cows. apart in the rows. If the flowers be to be preser- It is a raw, green, Dandelion, and is not quite ved, the flower-stalks should be cut off before so good .- The plants of these fine sorts may, in

the blossoms begin to fade at all.
229. LEEK. There are two sorts: the narrowin the fall, or, as early in the spring as you can .-About four yards square is enough. Put the rows eight inches asunder, and thin the plants to three about a fortnight before the general Cornplanting inches apart in the row.—Hoe deeply and frequently between the plants till the middle of July but in the east border, or in the west border. and then take the plants up, cut their roots off to Make the ground rich, right strong, break it well, half as wide apart. Manure the trenches with about the time of the early cabbages, and some rotten dung, or other rich manure. Put in the of them will not go off to seed for six weeks afthem up by degrees like celery; and at last, you will have leeks 18 inches long under goond, and as thick as your wrist. One of these is worth a dozen of poor little hard things. If you have a Lettuces, give them a little water, and, if it be a we boil a bunch amongst green peas, to which it

THE AMERICAN GARDENER. row across one of the Plats it will be plenty, per-small bed, shade them a little. If you sow in the haps. Such row will contain about a hundred and natural ground in the spring, be sure to transplant sixty. One third may be used, perhaps, before into the shady borders.—And be sure always to the winter sets in; another third is taken up and make the ground rich for these fine Lettuces. put by for the winter, in precisely the same way 23I. MANGEL-WURZEL.—This may be same way that Celery is, will be ready for spring dens. It is a coarse Beet, and is cultivated and use.—See Celery .-- Three leeks planted out for preserved as the Beet is. seed, will ripen their seed in August, and will

to give to five or six neighbours. as cabbage is, it is an excellent vegetable. Yet, and the bags hung up in a dry place.

I never saw a really fine Lettuce in America. The 233. MARIGOLD,—An ANNUAL plant. Sow or from offsets. A very little of it is enough for any garden.

The plants of these may be and a very mean one indeed. 227. JERUSALEM ARTICHOKE.—This preserved through the winter in the natural ground ant bears at the root, like a potato, which to in the manner directed for Endive plants (which knows, two distinct tribes: the Musk, and the deed be kept through the winter in the same manner, and with the same care, as Cauliflower bage-plants, for which see Paragraphs from 77

that Celery is; the other third, covered in the called Cattle-beet. Some persons plant it in gar-

232. MARJORAM.—One sort is annual and give you seed enough for the next year, and some one perennial. The former is called summer and the latter winter. The first sown as early as posbe trenched deeply and made pretty good. Half garden is milky, refreshing, and pleasanter to a offsets; that is, by parting the roots. The plants a square perch of ground, planted at a foot apart majority of tastes than any other plant, the Aspaway stand pretty close. As the winter sort canprincipal ingredient of a good salad, that it is preserved by drying. Cut it just before it comes both in France and England called "salad" by out into bloom, hang it up in little bunches to dry, great numbers of people. It is good in stews: good first, for a day, in the sun; then in the shade; bolied with green-peas; and, even as a dish boiled and, when quite dry, put it in paper bags, tied up

> which will not suffer those sorts to loave, if they dry, in the shade. When dry put them into pabe sowed in the natural ground in the spring.— per bags. They are excellent in broths and soups The hard sorts are the green cabbage-lettuce (or and stews. Two square yards planted with Mahardy green), and the brown cabbage. These are rigolds will be sufficient. It is the single Mari-lat plants. Their outside leaves spread forth gold that ought to be cultivated for culinary pur-

den; and to die up the corner of some field, and large. When you cut one of these from the stem, throw some seed or some roots into it.

228. LAVENDER. A beautiful little well-lump of white, enough for a salad for ten people, and only observe, that all that is there said ap-Sucumbers. The soil should be rich for melons but it ought not to be freshly dunged; for that is apt to rot the plants, especially in a wet year. They like a light and rather sandy soil, and, any leaved, and the flag-leek, the latter of which is plants (which see in Paragraph 209); but, if this where near the sea, wood ashes, or sopers' ashes, by much the best-Some people like leeks better be not done, you must raise them in the spring in is probably, the best manure, and especially in than onions; and they are better in soup -Sow precisely the same way as the very earliest cab-dry-bottomed land; for ashes uttract and retain the moisture of the atmosphere. It is a great to 94.—Put the plants out into the natural ground, mistake to suppose, that ashes are of a burning quality. They always produce the most and best effect in dry bottomed land .- Melons should be cultivated well. You should have but one plan; in a hill; and should till the ground between the an inch long, and cut off the leaves also a good and, in transplanting, keep as much earth as you plants, while they are growing, until it be coverway down. Make trenches, like those for Celery can about the roots, and give a little water; and ed by the vines. If the plants stand too close, the (which see), only not more than hulf as deep, and transplant in the evening .- These plants will loave vines will be weak, and fruit small, thick-rinded, and poor as to flavour.

235. MINT .- There are two sorts: one is of plants as you do the Celery plants, and at about ter they are loaved. So that, about two square a darker green than the other: the former is five inches asunder. As the Leeks grow, earth feet of a hot-bed will give you a great quantity of called hepper-mint, and is generally used for dis-

236. MUSTARD.—There is a white seeded tivation is as follows: sow the onions any time sort and a brown seeded. The white mustard is used between April and the middle of June, in drills in salads along with the Cress, or Pepper Grass, six inches apart, and put the seed very thick along and is sown and cultivated in the same way (See the drills. Let all the plants stand, and they will Cress.) The black is that which table mustard get to be about as big round as the top of your Cress.) The black is that which table mustard is made of.—It is sown in rows, two feet apart, early in the spring. The plants ought to be thinted to four or five inches apart. Good tillage between the rows. The seed will be ripe in July, and then the stalks should be cut off, and, when quite dry, the seed threshed out, and put by for use.—Why should any man that has a garden buy mustard? Why should he want the English to send him out, in a bottle, and sell him for a quarter of a dollar, less and worse mustard than he can raise in his garden for a penny? The English mustard is, in general, a thing Fabricated, upon the mark with your thumb and forefinger, the Parsnip stands all frost without injury, and sent out by the fraudulent fabricators of Manches, again before sent out by the fraudulent fabricators of Manchester. It is a composition of baked bones reduced should rise up about the plants.-Proceed after to powder, some wheat flour, some colouring, this as with sown onions; only observe, that, and a drug of some sort that gives the pungent if any should be running up to seed, you must taste. Whoever uses that mustard freely will twist down the neck as soon as you perceive it. find a burning in his inside long after he has swal- But, observe this: the shorter the time that these lowed the mustard. Why should any man, who onions have been in the ground the year before, not oe cut off in the fall. has a garden, buy this poisonous stuff? The mustard will they be to run to seed.—Pre- 241. PEA.—This is of tard-seed ground in a little mustard mill is what serving onions is an easy matter Frost never he ought to use. He will have bran and all; and hurts them, unless you move them during the time his mustard will not look yellow like the English that they are frozen. Any dry, airy place will composition; but we do not object to Rye bread therefore do. They should not be kept in a warm on account of its colour! Ten pounds of seed will grow upon a perch of ground; and ten pounds of mustard is more than any man can want in a tie them round sticks, or straight straw, with year. The plants do not occupy the ground more than fourteen weeks, and may be followed by another crop of any plant, and even of mustard if the spring.—To grow this seed upon a large scale presently see, they may be had, in the open you like. This, therefore, is a very useful plant, plough the land into four feet ridges, lay plenty of ground, in Long Island, from first of June till the every man who hus a garden.
237. NASTURTIUM—An annual plant, with

a half-red half-yellow flower, which has an offensive smell; but, it bears a seed enveloped in a will bear a great quantity of pods.—They will grow in almost any ground; but, the better the ground the fewer of them are necessary.

deep. Then fill in the drills; and then press the that to die away. It may be sown at any season distant from each other. In these I sowed the earth down upon the seed by treading the ground when the frost is out of the ground. The best peas. When the peas were about three inches all over. Then give the ground a very slight way is to sow it in spring, and in very clean nigh, I hoed the ground deep and well between smoothing over with a rake.—When the plants ground; because the seed lies long in the ground, the rows and on each outside of them. I then earth down upon the seed by treading the ground all over. Then give the ground a very slight smoothing over with a rake.—When the plants get to be three inches high, thin them to four inches, or to eight inches if you wish to have very large onions. Keep the ground clear of weeds by hoeing; but do, not hoe deep, nor raise earth about the plants; for these make them run to neck and not to bulk.—When the tips of the leaves begin to be brown, bend down the necks, so that the

gives a pleasant flavour; chopped up small, and to dry, in order to be put away for winter use .- the rest of the pot-herbs. It is possible to pres rve put, along with sugar, into vinegar, we use it as Some persons, instead of sowing the onions all sauce for roasted lamb; and a very pleasant sauce along the drill, drop four or five seeds at every it is .- Mint may be propagated from seed ; but a six or seven inches distance ; and leave the onions few bits of its roots will spread into a bed in a to grow thus, in clumps; and this is not a bad Green-house (or you may do it even in any of the year .- To have it in winter, preserve it precise- way ; for, they will squeeze each other out. They ike Majoram (which see), and, instead of chop- will not be large; but, they will be ripe earlier, thing it for sauce, crumble it between your fingers. and will not run to neck.—The third mode of culagain before you make the marks, for no earth place; for they will heat and grow. The neatest way is to tie them up in ropes; that is to say, to matting (See Endive) .- For seed, pick out the dung. Never were finer peas grown than there finest onions, and plant them out in tich land, in are grown in the United States; and, as we shall and ought to be cultivated by every farmer, and dung along the furrows, plough the ground back sharp frosts set in.—The sorts are numerous, one every man who has a garden.

The sorts are numerous, one every man who has a garden. and put along, on the top of a ridge two rows of latter grow taller, and are longer in coming to onions, the rows seven inches apart, and the onions perfection, than the former. The earliest of all seven inches apart in the rows. When the weeds is the little white pea, called, in Long Island, the fleshy pod, and that pod, taken before the seed becomes ripe, is used as a thing to pickle.—The and plough first from and then to the ridges, two orthree times at the ridges, two orthree weeks, blue Pea, the Dwarf, and Tall Marrowfats; the Spring. The plants should have pretty long as in the case of Ruta Baga, cultivated in the and several others, especially the Knight Pea, bushy sticks put to them; and four or five of them field.—When the seed is ripe, cut off the heads and the seed of which is rough, uneven shaped and collect them in such a way as not to scatter the shrivelled, and the plant of which grows very tall. seed. Lay them, on cloths, in the sun, till dry as —All the sorts may be grown in America, without dust; and then thresh out the seed, winnow it, and sticks, and even better than with. I have, this

it green because I have done it; but, it loses its amell and flavour. Therefore to have Parsley in winter you must keep it alive. If you have a window seats of a house) half a dozen flower-pots, planted with stout plants in September, and taken into the house in November, will be sufficient. As soon as winter breaks up, put them out in the natural ground; and thus you have plenty of Parsley all the year round. However, Parsley may be preserved in the natural ground. You have only to put straw, or leaves of trees, or long

put up for winter as many as you want during the hard frost, and these you may put up in the same manner as directed for Carrots and Beets.—The greens of Parsnips are as good for cow feed as those of Carrots; but, if the Parsnips be to stand out in the ground all the winter, the greens should

241. PEA.—This is one of those vegetables which all men most like. Its culture is universal where people have the means of growing it. The sorts of peas are very numerous; and I will mention a few of them presently .- The soil should be good, and fresh dung is good manure for them. Ashes and compost, very good; but peas, like Indian Corn, will bear to be actually sown upon tables. Its uses are many and they are all well known. The modes of cultivation for a crop are various. Three I shall mention, and by either a good crop may be raised.—Sow in the fall (See Paragraph 159,) or early in the Spring. Let the ground be rich but not from fresh dung. Make the ground very fine; make the rows a foot a part and scatter the seed thinty along a drill two inches heing to have a feet a part the ground to the seed winnow it, and sticks, and even better than with. I have, this year (1819) the finest peas I ever saw, and the manner, for the most abundant. And this is the manner, in which I have sown and cultivated them. I ploughed the ground into ridges, the tops of which (for the dwarf sorts) were four feet apart, I then put a good parcel of yard-dung into the same summer.

239. PARSLEY.—Known to every human to the sorts may be grown in America, without sticks, and even better than with. I have, this year (1819) the finest peas I ever saw, and the manner, in which I have sown and cultivated them. I ploughed the ground into ridges, the tops of which (for the dwarf sorts) were four feet apart, I then put a good parcel of yard-dung into the same summer.

239. PARSLEY.—Known to every human the first have the ground into ridges, the tops of which (for the dwarf sorts) were four feet apart, I then put a good parcel of yard-dung into the same summer.

239. PARSLEY.—Known to every human the first have the ground into ridges, the tops of which (for the dwarf sorts) were four feet apart, I then put a good parcel of yard-dung into the same summer. and, if the ground be foul, the weeds choak the ploughed the ground from them, and to them large onions. Keep the ground clear of weeds by and four wide, the seed sown in drills at eight large onions. Keep the ground clear of weeds by and four wide, the seed sown in drills at eight large onions. Keep the ground clear of weeds by and four wide, the seed sown in drills at eight large onions. It is a week or two afterwards they had hoeing; but do, not hoe deep, nor raise earth about linches apart is enough for any family in the another ploughing; and soon after this they fell, the plants; for these make them run to neck and not to bulk.—When the tips of the leaves begin where the winter is so long and so sharp as it is in the way in which I managed all the sorts, only in the bebrown, bend down the necks, so that the this country, the main thing is to be able to keep the case of the Knight Pea I put the ridges at six leaves lie flat with the ground When the leaves harsley through the winter. It cannot be pre-feet asunder.—This was, of every sort, the very are nearly dead, pull up the onions, and lay them served dry, with success, like Mint, Marjoram, and finest crop of peas I ever saw in my life. 255. RUTA BAGA.—(See Turnip.)
256. SAGE is raised from seed, or from slips.

257. SALSAFY, called, by some, oyster plant,

259. SAVORY .- Two sorts, summer and winter. The former is annual, and the latter perennial.

260. SAVOY.—See Cabbage, Paragraph 201.

261. SCORZENERA.-This is only another the same manner as Salsafy is.

s taken up in the fall and kept for winter use. give the information. 248. PURSLANE .- A mischievous weed Each plant multiplies itself in the summer by adding offsets all round it. One of them is a nothing else. Both use it in salad, that is to plant to put out in the spring to produce other fisets for use and for planting out again. They

not sucked, and sown upon level ground, peas Sown as early as possible in the spring, and a not be wet at bottom, and should be kept very

263. SKIRRET is cultivated from its root, which is used in soups. It may be raised from seed, or from offsets. It is perennial, and a very small patch may suffice.

265, SPINACH.-Every one knows how good and useful a plant this is. It is certainly preferable to any of the cabbage kind in point of There is, in fact, but one sort, that I know any thing of, though the seed is sometimes more prickly than at other times. To have spinach very early in the spring, sow (Long Island) on or about the first week of September, in drills a foot apart, and, when the plants are well up, thin them to six inches. They will be fine and strong by the time that the winter " in ; and, as soon as that time comes, cover em over well with straw, and keep the stra. on till the breaking up of the frost. Sow more as soon as the frost is out of the ground; and this will be in perfection in June. You may sow again in May; but the plants will go off to seed before they

266. SQUASH is, in all its varieties, culti-

vated like the Cucumber, which see.

267. TANSY, a perennial culinary and mediis raised from seed, from the roots, will grow in cinal herb, propagated from seed, or offsets. One

root in a garden is enough.

268. TARRAGON is a very hot, peppery
herb. It is used in soup and sallads. It is perennial, and may be propagated from seed, or young and tender tops only are used. It is eaten with beef-steaks in company with minced shalots. A man may live very well without it; but, an Englishman once told me, that he and six others once eat some beef-steaks with Shalots and Tarragon, and that "they voted unanimously, that beef-steaks never were so eaten!" It must be dried, like mint, for winter use.

269. THYME.—There are two distinct sorts. Both are perennial, and both may be propagated

either from seed, or from offsets.

270. TOMATUM.—This plant comes from the countries bordering on the Mediterranean. To have it at hand for winter it is necessary to In England it requires to be raised in artificial dry it; and it ought to be cut, for this purpose, heat, and to be planted out against warm walls. you once get this sort, and wish to keep it, you before it comes out into bloom, as indeed, is the Here it would require neither. It climbs up very high, and would require bushy sticks. It bears a sort of apple about as big as a black walnut with is good in soups, to eat like the parsnip. It is its green husk on. Its fruit is used to thicken stews and soups, and great quantities are sold in London. It is raised from seed only, being an 258. SAMPHIRE is propagated from seed, annual; and the seed should be sown at a great or from offsets. It is perennial, and is sometimes distance, seeing that the plants occupy a good deal of room.

(To be Continued.)

ler can be made to resist this enormous interna pressure, we may confidently conclude, that an iron boat, constructed in a similar way, will be adequate to sustain any external force, which it is likely to encounter from the buffeting of the waves.

2.-Durability. The considerations under the last head apply with equal force to this; but to these I would add, that an iron boat is not subject to injury from the effects of the sun; nor from the still more injurious attacks of the worms in southern latitudes. The oxidation of the iron, which will appear to some to detract much from its durability, will be found of very little moment in practice.

3.-Rate of sailing. The smooth surface of shape built of wood.

4.—Capacity for burthen. It is found to hold universally, with respect to canal boats, that those made of iron (of which there are numbers constantly in use) will carry a larger cargo than wooden boats of the same size. The result must

all; and will, no doubt, insure a favourable recharge itself of any quantity of water it may ception to every attempt that may be made to happen to ship in a rough sea. Should the boat say something of the comparative cost of the remedy the evil. The most obvious method that be loaded deeper than the level of the floor, the common, and the proposed boats. This I can presents itself to the mind, of accomplishing this water is prevented from rising into the interior only speak of at present on conjecture; I think may however safely state, that iron boats, with In order to show the practicability of the plan, the safety apparatus included, will not exceed the this practice must have arisen from the general I have built a boat, which nearly answers to the cost of wooden ones, more than fifty per cent.—
unfitness of such boats for common use. To re- above description. It is seventeen feet eight Even at this rate, and considering them only in move this obstacle, I have constructed a life-boat inches long, six feet wide, three feet deep, draws the light of common boats, they will be the cheapest in the long run. But as the facility of hundred, two quarters, and twenty pounds. The making them will increase by practice, and by experienced seaman, on inspection of this boat, the invention of Machinery, I should not be surprised to see them sold much lower than wood ones, before the lapse of many years.

Any gentleman desirous of trying my boat, may in general. The one to which I refer was built put it to what proof he thinks proper, on appliin a great measure from written descriptions, and cation to Mr. Parry, boatman, who has the care of it, at the George's Dock, ferry basin. A motown. Objections of this nature may, therefore, del, shewing clearly the principle on which it acts, I beg permission to lodge for inspection at the office of the Mercury newspaper. And any further information on the subject that is desired, I shall be happy to communicate as far as lies in my

TO THE EDITOR OF THE AMERICAN FARMER.

WOOL-Farmers invited to report the quantity annually obtained per head from their flocks.

White Post, Frederick County, Va. 20th January, 1823.

DEAR SIR,

More than a twelve month past an invitation was given to the growers of wool, through the medium of your useful pages, to furnish informamers might compare the value of the different Mr. George W. P. Custis, for the origin of a re-changed my recollection of them, I can safely breeds of sheep, and trace their improvement markable ram, of that breed, which I raised in recommend an importation of some of their cows. from year to year. It was hoped that the adoption of some such plan would bring together in-riod, in this county. This cross, although I beformation on the subject, from various quarters, productive of considerable advantages; not merely to the breeders of sheep, by suggesting intermixtures, &c. &c., but to the country at large, by favouring the improvement of our different manufactures of wool. The invitation, as yet, ap- the third cross, I find the wool to have exchange pears to have been neglected : will it be too officious, again to urge the importance of the measure, and set the example by way of commence- ful for our country purposes, and yielding nearly ment? We plain farmers are too often under an impression, that it is necessary to write in a handsome style and technical manner, to make the offering acceptable. But, waving such scruples, I will now mention the result of my last shearing, which took place in June 1822. The average, which took place in June 1822. as per certificate, which I hold, is nearly 7 lbs. per head; that of the previous year was about 8 lbs. This apparent falling off, of a pound in the fleece, is to be accounted for in my having parted with 20 of my best sheep, in March last, to one of your butchers, which left me but few wethers and a large proportion of ewes, with lambs by their side, in my flock. These circumstances taken into consideration, I am satisfied that there has been a considerable improvement in my flock, since the shearing of 1821. number shorn in June last, was as follows:

nearly. nearly. nearly. 9 1-8 51-4 7 average 7 4.b op 9 2704 €89 156 total P 21 18 wool Ewes e Bakewell oss on the erino Ewe. Kam long Wethers, Merino, Long

unwashed, but the tags excluded. Having sheared my sheep at some distance from the house, I have not been so particular as I could have wished in selecting samples, and ascertaining the relative weight of carcase to the wooland I am unwilling at this time to hazard an opinion on that head—but if you think such me-morandums would be useful, I will endeavour, at the next shearing, to be more attentive to facts that relate thereto. I have been induced to adopt a cross of the long wool, on the Merino, with a view to a greater quantity of wool, better adapted to domestic purposes, anticipating also a restoration of such mutton, as we formerly had from our improved English breeds: in which expectation I have not been disappointed, having already obtained a cross of large size, affording excellent mutton, and carrying a heavy fleece : much superior in quality to those of my former Bakewell race, or more strictly speaking, Ar-lington.-Edit. Am. Farmer.

riod, in this county. This cross, although I be-lieve it is deprecated in England, I shall continue, by selecting Rams of the longest, closest, finest wool, so long as the fibre increases in length without diminishing too much its fineness and closeness. As far as I have gone, which is about ed its merino softness, for a silky quality less adapted, to be sure, for broad cloth, but much more use double the quantity of the merino, when both have been completely cleaned of the dirt, and prepared for the cards. This difference is explained by the half blood having a greater surface, than the merino, double the length of wool, and an increased thickness, as they partake of the merino, which possesses this quality, in a remarkable degree.

I am respectfully, Yours, &c. &c. R. K. MEADE.

* We shall be glad to obtain and record such details: as every report of facts serves to give knowledge to our readers, which enables them to institute comparisons, that must tend to their The weight of carcase, the proadvantage. portions of its different parts, and the period of maturity, are items too important, to be over-looked in any estimate of the value of different breeds of sheep. Indeed it would difficult to err by multiplying comparative points of observation .- Ed. Am. Farmer.

White Post, Frederick County, Va. ? January 20, 1823.

NAPLES CATTLE-AN EXCELLENT BREED. DEAR SIR,

Permit me to add my testimony to that of Capt. Jacob Jones, in favour of the Naples cattle. Having spent two or three weeks there in Dec. 1804, I had frequent opportunities of seeing their cows and work oxen, although I do not remember to have seen a bull. Previously having been a farmer, and accustomed to see fine cattle here, and in the New England States, my attention was and in the New England States, my attention was Should you desire it, I can furnish you with naturally drawn to a comparison between foreign Onion seed of a very superior quality—large flat, stock, and our own. I have always mentioned the they were of a light dun colour,* but I must prepeared to be animals of great frame, and had un-commonly large horns; they were worked in large mation to that effect by mail will be necessary. sized horse carts, single, and hauled a burthen I believe often exceeding a ton, with ease—they not less advantageous to yourself, than it is useful were very docile. With respect to their peculiar to the public, I have the honour to be Sir, form, I am not aware of any positive recollection, being chiefly attracted by their commanding ap-pearance, and the great loads they moved. The form of their cows I well remember—clean made, square built, and bulky, with sufficient frames to

and disseminate valuable seeds.

I enclose a few Musk melon seeds, of a kind much superior to any I have ever met with. We received the seeds by the name of Persian melon. Its size is large, and its flavour delicious. It is, however, rather late in ripening. We have raised this kind for the last eight or ten years, and always on the same shot, without discovering the slightest depreciation. We last year adopted a contrivance (on the recommendation of another,) which I regard as of very great importance in the cultivation of melons. As soon as the young plants appeared, we put over them a box consisting of four pieces of shingles, or thin boards, nailed together, one foot long, and about eight inches broad-over the top of this box is stretched, a thin piece of worn out muslin, or millinet, and the edges fastened with tacks to the side of the box. This cover, while it admits the air and light, protects the plants effectually from bugs and flies, and shields them from cold winds and frosts. The difference in the growth of the plants thus covered, and those which were left unprotected, was almost incredible, and I observed that while the latter were parched with the drought, the soil round the others was constantly moist, and their leaves in the morning were loaded with dew.

white onion-a kind we have raised in our garden Naples to my friends as the finest cattle that I had for more than twenty years; and although for ever seen. My impression has always been that nearly the whole of that time planted every year in the same beds, we have never found it necessary sume I am mistaken, since Capt. Jones has so re- to change our seed .- As I find it more convenient cently viewed them. Their oxen were large to receive your volume at the end of the year, enough when fat to weigh from 1000 to 1200—ap-than in weekly numbers, should you wish for this, mation to that effect by mail will be necessary.

With the best wishes that your work may be to the public, I have the honour to be Sir, Your obd't servant,

JOHN S. SKINNER Esq.

From the writer of the above, we should be weigh six, seven, and probably eight hundred, happy to hear frequently-and we take this occawhen fat-they were beautiful, looked well adapt- sion to explain as to seeds of vegetables, melons, ed to the butcher, and in a superior degree to vines, flowers, grains, &c., that when they can be recommended as of a quality in any degree superior to what is in common use, of the same art, when he returned from his command in the kind; we shall always esteem it a favour to be Mediterranean, were, as we have understood, of supplied with small portions,-together with an leisure for practical experiments. It is quite as

to superintend the business of a large Post Office, zed life-for instance, their living in well built returned on board the ship, Dr. tion may be said to be engaged.—When seed such which appear to me to be of a religious origin. tripetal and centrifugal motion, from, and to every point of the compass, and thus are the good and equally diffused.

PATTERSON, N. J. February 5, 1823. PORK EXTRAORDINARY.

We are reputably informed, that Mr. John Flood, of this town, recently purchased four of the ten pigs, which, with the sow, obtained the premium in Sussex County the past season.— The weight of the four above mentioned, are stated to be severally.

1439 lbs.

Age 14 months.

One of the ten having been hurt when young, was killed, and weighed only about two hundred weight, the remaining nine (one of which weighed 469 lbs.) with the sow, are said to have weighed between 37 and 38 hundred weight-altogether, this whole family of eleven, exceed two tons in

We have not the name of the gentleman who received the premium in Sussex, but we wish him success in his enterprize. - Chronicle.

WILD-GARLIC-CAN IT BE ADVANTAGEOUSLY to this from its inventor, will much oblige CULTIVATED?

Adams County, Pa. January 6, 1823.

J. S. SKINNER, Esq.

Sir-I have observed in No. 41, of this Vol. your liberality in making inquiry respecting the best method of Cultivating the Crab Grass; which has encouraged me to make a similar request-one, that in my opinion, is of no less im-

portance.

I have been told that the Wild Garlie, has many valuable qualities, which make the cultivation of it very desirable for early pasture, and to afford a richness or high flavour to milk and butter, that cannot be obtained from any other plant. I have not seen any of this valuable plant cultivated, either in drill or broad cast-therefore any information respecting its cultivation, would be thankfully received from your numerous correspondents.

Your's Respectfully, JOHN BOULSTER.

BALTIMORE, FRIDAY, FEBRUARY 14, 1823.

IMPORTANT TO COTTON PLANTERS. We are happy to have it in our power to state, that Jas. A. Buchanan, Esq. of this city, has importat the Isle of France, Martin Bickham, Esq. a bag of cotton seed, specially picked and prepar- in Sheets:ing, in that colony, who has kindly furnished some interesting remarks upon the most approved plan of cultivating it. We understand this seed is deposited at the store of the Warren seed is deposited at the store of the Warren Factory, No. 3, Hanover-street, where all applications either by letter or otherwise, for RICHARD COTTOM, Petersburg. small quantities, will be gratuitously attended to whilst it lasts. We hope the distribution of this truly valuable seed, will be judiciously made by W. F. REDDING, special agent, now journey-Mr. Buchanan, for it is well known, that the cotton of the Isle of France is superior to any in the world, with the exception of our very best long staple Sea Islands. It behoves our most ac- application being made, by letter or otherwise, to A Jerseyman offers to bet that he will kill a live planters to follow up this attempt to introginated. We shall of course expect all those

CULTIVATION OF COTTON AT THE MAURITIUS.

It is planted here in the months of November and December, (our spring,) and the trees last cut off nearly even with the earth, and they shoot up again to nearly their usual height, when it is necessary to turn off their tops, and keep them at the height of about four feet and a half. They are planted in rich ground at 7 and 8 feet distance, one from the other; and in poor ground, at about 5 feet distance, only two plants are left in the same hole, and the seeds are planted about one inch under ground; it is necessary to keep the field very clean, and clear of weeds, and let the cotton be perfectly dry before it is collected: the plants ought to be hoed, and their roots, well covered when young. After the cotton is collected, it is passed through a mill, and cleaned by means of cylinders, after which it is picked by hand, and freed of all dirt, and impurities, then sent to the press to be embaled.

This, then, like the carrying off the farina from and the abundant crops, which, with proper were put on the hlum and the apple on the crab. account. In 1800, I sent several trees from England to Messrs. James and Thomas Paul, at Busleton, in Pennsylvania. There was a Nectarine amongst these. It is well known, that, in 1817, there had for planting, of the aspect, of the nature of the by a stake; but it must not be fastened to a stake, been so great a mortality in the peach orchards, soil, of the preparation of the soil; for these until rain has come to settle the ground; for, such

and to hoe it frequently. I cannot help observe that they had become almost wholly extinct. At have all been described in Chapter I, Paraing here upon an observation of Mr. MARSHALL: Busleton there had been as great a mortality as graph 20, save and except, that, for trees, the "as to "weeding," says he, "though seedling in any other part. Yet I, that year, saw the ground should be prepared as directed for Aspa-"trees must not be smothered, yet some small Nectarine tree large, sound in every part, fine ragus, which see in its Alphabetical place, in weeds may be suffered to grow in summer, as and flourishing. It is very well known, that the Chapter IV. "they help to shade the plants and to keep the peach trees here are very short-lived. Six, seven 284. Before the reader proceed further, he "ground cool." Mercy on this Gentleman's or eight years, seem to be the duration of their life. should read very attentively what is said of transreaders! Mr. Marshall had not read Tull; if This Acctarine had stood seventeen years, and was planting generally, in Chapter III, paragraph he had, he never would have written this very likely to stand twice as long yet to come. It is 109 and onwards. He will there perceive the erroneous sentence. It is the root of the weed now growing in the garden of the late Mr. James absolute necessity of the ground, to be planted that does the mischief. Let there be a rod of Paul, in Lower Dublin Township; and there any in, being made perfectly fine, and that no clods, ground well set with even "small weeds," and one may see it —It is clear to me, therefore, that great or small, ought to be tumbled in about the another rod kept weeded. Let them adjoin each the short life of the peach-orchards is owing to the roots. This is so capital a point, that I must other. Go, after 15 or 20 days of dry weather; stock being heach. No small part of the peach-request the reader to pay particular attention to examine the two; and you will find the weedless trees are raised from the stone. Nothing is more it. To remove a tree, though young, is an operaground moist and fresh, while the other is as dry frequent than to see a farmer, or his wife, when tion that puts the vegetative faculties to a severe as dust to a foot deep. The root of the weed sucks he or she has eaten a good peach, to go and test; and, therefore, every thing should be done up every particle of moisture. What pretty make a little hole and fut the stone in the ground, to render the shock as little injurious as possible. things they are, then, to keep seedling trees in order to have a heach tree of the same sort! 285. The tree to be planted should be as young cool!—To proceed: these seedlings if well ma-Not considering, that the stone never, except by naged, will be eight inches high, and some highmere accident, produces fruit of the same quality
er, at the end of the first summer. The next as that within which it was contained, any more
possible in the spring. The ground being prespring they should be taken up; or this may be than the seed of a carnation produces flowers like pared, and the tree taken up, prune the roots done in the fall. They should be planted in rows, those from which they proceded.—The peaches with a sharp knife so as to leave none more than four feet apart, to give room to turn about amongst in America are, when budded, put on peach- about a foot long; and, if any have been torn them; and at two feet apart in the rows. if intend- stocks; and this, I think, is the cause of their off nearer to the stem, prune the part, so that ed to be grafted or budded without being again swift decay. They should be put on plum-stocks; no bruizes or ragged parts remain. Cut off all the removed. If intended to be again removed, be- for, to what other cause are we to ascribe the fibres close to the roots; for, they never live, fore grafting or budding, they may be put at a foot long life and vigorous state of the Nectarine at and they mould, and do great injury. If cut apart. They should be kept clean by hoeing be- Mr. Paul's? The plum is a closer and harder off, their place is supplied by other fibres more tween them, and the ground between them should wood than the peach. The peach-trees are de- quickly. Dig the hole to plant in three times be dug in the fall, but not at any other season of stroyed by a worm, or, rather, a sort of maggot, as wide, and six inches deeper, than the roots the year.—The plants will grow fast or slowly that eats into the bark at the stem. The insects actually need as mere room. And now, besides according to the soil and management; and he do not like the plum bark; and, besides, the who knows how to bud or to graft, will know plum is a more hardy and vigorous tree than the sifted. Lay some of this six inches deep at the when the stock is arrived at the proper size for peach, and, observe, it is frequently, and most bottom of the hole. Place the roots upon this in each purpose.-To speak of the kind of stocks frequently, the feebleness, or sickliness, of the their natural order, and hold the tree perfectly most suitable to the different kinds of fruit-trees tree that creates the insects, and not the insects upright, while you put more sifted earth on the is reserved till we come to speak of the trees that create the feebleness and sickliness. There roots. Sway the tree backward and forward a themselves; but there are some remarks to be are thousands of peach trees in England and little, and give it a gentle lift and shake, so that made here, which have a general application, France that are fifty years old, and that are still the fine earth may find its way amongst the roots relative to the kinds of stocks.—It is supposed in vigorous fruitfulness. There is a good deal in and leave not the smallest cavity. Every root by some persons, that the nature of the stock climate, to be sure; but, I am convinced, that should be closely touched by the earth in every affects the nature of the fruit; that is to say, there is a great deal in the stock.—Before I quit part. When you have covered all the roots with that the fruit growing on branches, proceeding the subject of stocks, let me beg the reader never, the sifted earth, and have seen that your tree from a bud or a graft, partakes more or less of if he can avoid it, to make use of suckers, par-stands just as high with regard to the level of the the flavour of the fruit which would have grown ticularly for an apple or pear-orchard, which ground as it did in the place where it before stood, on the stock, if the stock had been suffered to almost necessarily is to become pasture. Stocks allowing about 3 inches for sinking, fill up the MARSHALL's notion. But, how erroneous it is, the ground remain in grass for a few years, there plat, and when you have about half filled it, tread must be manifest to every one when he reflects will arise a young wood all over the ground; and that the stock for the pear tree is frequently the this wood, if not torn up by the plough, will, in a Put on the rest of the earth, and leave the surface white-thorn. Can a pear partake of the nature short time, destroy the trees, and will in still less perfectly smooth. Do not water by any means. which is a stone-fruit too? If this notion were this, suckers, being originally excrecences, and and makes cavities amongst the roots. Lets in correct, there could be hardly a single apple-unnaturally vigorous, make wood too fast, air. Mould and canker follow; and great injury orchard in all England: for, they graft upon make too much wood; and, where this is the is done. erab-stocks; and, of course, all the apples, in case, the fruit is scanty in quantity. "Haste the course of years, would become crabs. Apri cots and Peaches are, in England, always put on plum-stocks; yet, after centuries of this practice, they do not become plums. If the fruit of the stocks why the male to the female flower is a mere whim, or dream. The bud, or graft, retains its own nature, wholly unchanged by the stock; and, all that is of consequence, as to the kind of stock, is, where the stock are surely stock as the stock and all that is of consequence, as to the kind of stock, is, where the stock are stocked with bloom; and from all of it there some grow on peach, and apple on apple, the trees are tude to God for such a blessing, is, to act well five or six feet high, unless cattle are to be kept not nearly so vigorous and durable as if the peach our part in turning the blessings to the best out for two or three years. And, in this case, the

rest of the hole with the common earth of the Water, poured on, in this case, sinks rapidly down,

286. If the tree be planted in the fall, as soon as the leaf begins to be yellow; that is to say, in October early, it will have struck out new roots to the length of some inches before the winter sets in. And this is certainly the best time for doing the business. But, mind, the roots should be out of ground as short a time as possible; and should by no means be permitted to get dry, if you can avoid it; for, though some trees will live after having been a long while out of ground, the shorter the time out of ground the sooner the roots strike; and, if the roots should get dry before planting, they ought to be soaked in water, rain or pond, for half a day before the tree be

CULTIVATION.

the trees grow, which consists of digging, hoeing itself differs with the sort of tree; and, there of any sort. And, if there be, take care to defore, I shall treat of the management of each stroy them. Pull, or scrape, off all rough bark sort under its own particular name. But the at the bottom of the stem. If you even heel off

take is just so much taken from the fruit, either destroy, or drive away, all insects. in quantity, or in quality, or in both. It is true,

cipal part of their nourishment comes from the sects on the stems and bark of the trees. top-soil. The ground should be loose to a good depth, which is the certain cause of constant but, nine times out of ten they proceed from the moisture; but trees draw downwards as well as root. Insects are much more frequently an effect upwards, and draw more nourishment in the for-than a cause. If the disease proceed from blight, mer than in the latter direction. Vine-yards, as there is no prevention, except that which is sugor other; or they will produce nothing of value, frequently blighted when healthy ones are not; He adds, that Mr. EVELYN says, that "when but, when the insects come, they add greatly to the

294. Now, then, as to the trees in my garden; they are to be choice peaches, nectarines, apricots, quire no stakes. They may be planted the se- plums, cherries, and grape vines, with a very few cond year after budding, and the first after graft-apples and pears. The sorts will be mentioned ing; and these are the best times. If planted in hereafter in the Alphabetical list; but, the the fall, the tree should be shortened very early tillage for all except the grape vines, is the same; in the spring, and in such a way as to answer the and the nature of that exception will be particu- nearly the whole, the best way is to cut them

295. It was obsreved before, that the ground 289. If you plant in the spring, it should be as is always to be kept clear of weeds. From the early as the ground will bear moving; only, bear spring to the fall frequent hocing all the ground in mind, that the ground must always be dry at over, not only to keep away weeds but to keep ton when you plant. In this case, the new roots the ground moist in hot and dry weather, taking will strike out almost immediately; and as soon care never to hoe but when the ground is dry at as the buds begin to swell, shorten the head of the not. This hoeing should not go deeper than four tree. After a spring-planting it may be neces- or five inches; for there is a great difference besary to guard against drought; and the best pro- tween trees and herbaceous plants as to the renewal of their roots respectively. Cut off the lateral round the tree, so as to cover the area of a circle roots of a cabbage, or a turnip, of a wheat or a rye of three feet in diameter, of which circle the stem or an Indian-corn plant, and new roots, from the of the tree is the centre. This will keep the parts that remain, come out in 12 hours, and the ground cooler than any thing else that you can put operation, by multiplying the mouths of the feeders of the plant, gives it additional force. But, the roots of a tree consist of wood, more or less hard: to be planted, that must depend on the sort of they do not quickly renew themselves: they are tree, and on other circumstances. It will be seen of a permanent nature: and they must not be India, and a more merciful one than what is geneby looking at the plan of the garden (Plate I), much mutilated during the time that the sap is in

of grape uines extending the length of two of the plats. The trees will have a space of 14 feet or the digging between trees ought to take square each. But, in orchards, the distances for place only in the fall, which gives time for a apples and pears must be much greater; other renewal, or new supply, of roots before the sap wise the trees will soon run their branches into, be again in motion. For this reason, if crops be grown under trees in orchards, they should be that does not demand a ploughing of the ground 291. The Cultivation of fruit trees divides in the spring. In the garden, dig the ground well itself into two distinct parts; the management of and clean, with a fork, late in November. Go the tree itself, which consists of pruning and close to the stems of the trees; but do not bruize tying; and the management of the ground where the large roots. Clean and clear all well close tant places in the spring of the year, for the bees and manuring. The management of the tree there. Ascertain whether there be insects there for that reason I shall here give directions con- with water, in which tobacco has been soaked; and do this, whether you find insects or not. 292. In the first place, the ground is always Put the tobacco into hot water, and let it soak

that very fine orchards have grass covering all all harbour for insects you make the ground smooth flame and makes a great smoke, is lighted and the ground beneath the trees; but these orchards just round the stem of the tree, let the rest of would be still finer if the ground were kept clear the ground lay as rough as you can; for the from all plants whatever except the trees. Such a piece of ground is, at once an orchard and a frost, which is a great enricher of all land. When thinks they can spare, leaving a sufficiency for pasture; what is lost one way is, probably, gained the spring comes, and the ground is dry at the the other. But, if we come to fine and choice top, give the whole of the ground a good deep fruits, there can be nothing that can grow beneath to balance against the injury done to the trees. hoeing. which will make it level and smooth enough. Then go on again hoeing throughout the 293. The roots of trees go deep; but the prin-summer, and watching well all attempts of in-

298. Diseases of trees are various in their kind: Tull observes, must always be tilled, in some way gested by the fact, that feeble and sickly trees are "the soil, wherein fruit trees are planted, is constantly kept in tillage, they grow up to an "Orchard-in half the time, they would do, if "the soil were not tilled." Therefore, tillage is useful; but, it were better, that there were tillage without under crops; for these crops take away boiling water on them. A line dipped in tar tied crease at least ten fold the year after.

fastening would prevent it from siuking with the a great part of the strength that the manure and round the stem, will keep them from climbing the earth. The earth would sink from it, and leave tillage bring. minutive creatures that appear as specks in the bark; the best, and perhaps, the only remedy against the species of disease of which they are the symptom, consists of good plants, good planting and good tillage. When orchards are seized with diseases that pervade the whole of the trees, or down: they are more plague than profit, and, as long as they exist, they are a source of nothing but constantly-returning disappointment and mortification. However, as there are persons who have a delight in quackery, who are never so happy as when they have some specific to apply, and to whom rosy cheeks and ruby lips are almost an eye-sore, it is perhaps, fortunate, that the vegetable world presents them with patients; and thus, even in the cotton-blight or canker, we see an evil, which we may be led to hope is not altogether unaccompanied with good. (To be Continued.)

FROM THE NATIONAL GAZETTE.

Messrs. Editors,

A paragraph in your Gazette of Saturday, on the subject of Bees, induces me to mention, that an easier method of gathering the honey than in rally pursued in this country, is practised in Germany .- There, this interesting little insect is cultivated to great extent, frequently as an amusement, and very commonly as a source of revenue. Many treatises have been written on their singular nature, domestic arrangements and the best mode of treating them. Perhaps I put some of your readers in mind of the renowned Baron of wheat, rye, winter-barley, or of something Munchausen, when I state that in some parts of Germany they are regularly taken to pasture! yet such is the fact. I have seen on the great heafh of Luneburg in the Hanoverian dominions, hundreds of Hives that were carried there from disround the stem. Make the ground smooth just to pasture on the heath flowers; herdsmen attend them; and in the autumn they are taken home again.

The mode of securing the honey is this, early in the fall the Bee-father (as the person who culmanagement of the ground where trees grow is the outside bark a foot or two up, in case there be tivates Bees is called) protects himself with the same in the case of all the larger trees; and insects, it will be the better. Wash the stems gloves and a kind of cap long enough to hang over his neck and shoulders, and which has a wire mask-and in dark rainy weather, or early in the morning or late in the evening, when all to be kept clear of weeds; for whatever they 24 hours, before you use the water. This will the Bees are at home, he turns the hives upside 297. But, though, for the purpose of removing wrapped in tow and linen, which burns without down-a match made of dry herbs, such as rue the smoke blown upon the hive, which drives the winter provision. Should it happen that the Beefather takes too large a tribute, or that an early winter prevents the Bees from replenishing their stock as expected-they then are regularly fed with a composition consisting of sugar, honey wine and water, boiled together, which is put in a saucer under the hive.

TOBACCO OF UPPER CANADA.

Your's,

A GERMAN.

A letter from Amherstburgh, Upper Canada, published in the Quebec Gazette, says-" There has been some stir this winter in consequence of

4th. (D.) The clearer is placed horizontal with, and parallel to the cylinder. Its length is the same as that of the cylinder, and its diameter is proportioned by convenience. There are two or four brushes or rows of bristles, fixed in the surface of the cleaver, in such a manner, that the ends of the bristles will sweep the surface of the cylinder. Its axis and boxes, are similar to those of the cylinder. It is turned by means of a band F, and whirls ;-it moves in a contrary direction from the cylinder, that puts it in motion, by means of the two small whirls G G, whose axis are pivots made fast in the frame, and it so far outruns, as to sweep the cotton from the teeth, as fast as it is carried through the breastwork .-The periphery of the whirls is spherical, and the band a broad strap of leather. And at H, there is a groove to permit the wheel G, to recede from the other, to tighten the band by a screw at the end under A.

5th. One side of the hopper E, is formed by the breastwork C, the two ends by the frame, and the other side J, is moveable from, and to-wards the breastwork, so as to make the hopper more or less capacious.

The cotton is put into the hopper, carried through the breastwork by the teeth, brushed off from the teeth by the clearer, and flies off from the clearer, with the assistance of the air, by its own centrifugal force. The machine is turned by water, horses, or in any way, most convenient.

There are several modes of making the variousparts of this machine, which together with their particular shape, and formation, are pointed out and explained in a description with drawings; attested as the Patent Laws direct, and lodged in the office of the secretary of state.

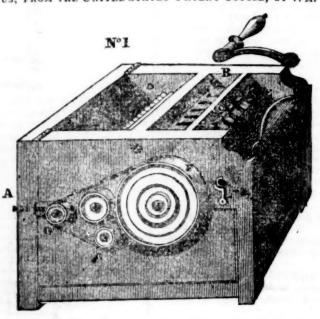

A sectional side view of parts of the machine,

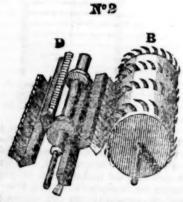

s given in Fig. 3, above, wherein

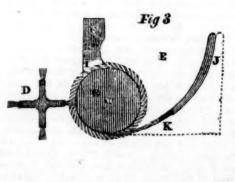

B, represents the cylinder, with rows of iron or other metal teeth, which pass through I, the

Figure 11. Shows how the screen is made.

One slat at each end of the cross sticks, with At the sides of the gin stand, there should be holes at equal distances in the slats, to receive the face within. It is necessary, almost every day to air holes of about 12 or 13 inches, cut out of the slip these doors, and sweep the screen, as in damp upper part of the stand, in form of half a cylinport the sticks in the middle. This stick should weather, many false seed, dirt and leaf will column and opposite the upper half of the brush cyling. linder, or clearer, as this is the only way that air springing or warping out of a true line; they * We have only shown a portion of the trunk, can be admitted to the brush, with advantage-should be regularly spaced at such distances in its length, of course the slight elevation, at in this manner, likewise, the greatest quantity of apart, as to suffer a cotton seed readily to drop the extremity is not seen in our cut.

It is evident, that a brush through; the sticks should be nearly round, being serving as a fan, should have but four arms, as a little flatted at bottom, and made of a wood that

Edit. Am. Farmer.

will receive a good polish. My own are made of bent, when laid with steel; this can be done, and cherry, and polished with sand paper, they are nearly half an inch in diameter. I have given end views of the side slats; sharp at top, so that when the screen is labeled, we me sides of the thurs, and no trash can settle on them. The middle slat is rounding on the top edge, for the same purpose; they can be made of plank, one inch thick, and three broad.

Figure 12, in the above cut, gives a side view of the eddy boards, that are to extend cross-wise of the trunk, with the niches on top of it, for the lower edges of the slats to drop in. Up on these boards, the screen will rest its whole ex-tent. An end view is also presented of this board, made sharp at top, to prevent trash from settling on it, in passing through the sticks.

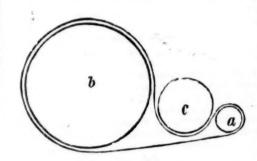

Figure 13. Is to give a front view of one bar of a grate, with a niche, at the upper shoulder, to enable us to take out the false seed.

The roll will bring up the tag of cotton attached to the false seed, on the back of the grate, to the turn at Figure 2; then as other tags come on, the preceding ones will be forced on to the niche, when they can either be removed or suffered to drop. If they drop, they will be stopped before they reach the saws, by a piece of leather, that sets off from the wood, in a direction towards the grate, and touches it; the leather will yield to the passage of the false seed, and then fall back to its place; this piece of leather is noticed of 26 inches, which is coupled to the brush pulthus, * in cut numbered one to nine. Were we to have the niche at the top of the roll, where the grate makes a sudden turn back, the false seed would be brought into the roll again; but as the ginner has time to remove a great many, I adpoted the plan to make the place for their removal farther back. I consider this form of a grate, very essential in a point, not yet noticed; which is, that it enables us to gin much faster; for when there is a tag of cotton throwing up the roll just above the saws, preventing them from ta-king as much cotton along with them, as they would otherwise do, and a wad of false seed under and between the grate, the saws are always ty of the fibres being cut or broken.

It is better for a small seed to escape, than for sible to keep always from rubbing, I have adopted this plan, and I think with advantage: From the upper end of the grates, to an inch below the point, where the saws pass through, (saving the phur match in it, and keep the bung close stopniche,) they should be very near to each other; ped for about two hours; then put in four gallons then the distance between them should gradually of good apple or cider brandy; then take four galwiden, so as to let the dirt, leaf, and small beards lons of the cider immediately from the press, and fall readily as they get loose. It is a matter of put it to the brandy, shaking the barrel well to the greatest importance, that every grate, be-absorb the sulphurous gas, (the cider ought to fore going to a gin, should be laid with steel; a be strained through a flannen,) and then fill the short, thin piece, can be easily welded on that barrel with the cider before any fermentation has part of the grate, where the saws pass. When taken place, and bung up the barrel tight immethis is done, one set will last longer, than six or diately, and put it in a cool place, and rack it off eight without it. I have never known a gin to in March following. If it is not fine when rack-prepare cotton as well the second and third ed, it may be fined with the whites of eggs—and years, as the first; and the reason is very obvious: as soon as quite bright, rack it again into a clean the corner of the grate, wears a little, and as soon as cask and it will keep for years. Some persons do not sulphur the cask, under an idea that it produ-

It is perhaps unnecessary to see much on the corecat motions, small pulles should be solid, nd large ones have spokes, each should be nade of plank, and placed so as to preserve the ircle, if the timber should shrink. Tightening ullies should always be large; their axles will eat less, and also enable us to cause the band to mbrace more of the pulley that is to be driven The placing of the pullies depend entirely up-on the form of the stand. My gin has on the right end of the rag cylinder, a pulley, a,

of 11 inches; this, coupled to a drum or big band wheel, b, of 8 feet diameter, drives the cylinder, and is tightened by a pulley, c, 3 feet diameter: at the other end, or to the left is a pulley, d,

ley, e, of a little more than 4 inches diameter, and a tightening pulley f, of 20 inches diameter, hung in a sliding frame nearly over the brush pulley, which keeps the band to a necessary degree of tightness by a weight suspended to a sweep, or roller and lever.

>06 CIDER ROYAL AND BARLEY COFFEE. Vineyard, near George Town, Feb. 8, 1823.

J. S. SKINNER, Esq,

Dear Sir,-I observe in your Farmer of yesterday, a receipt to make Cider Oil, as you call itrobbed, of more or less cotton, in their passage. I have some doubts that the person who furnished Where the saws pass the grate, as above, at 14, you with the receipt, is ignorant of what it exit will be observed, that the bars of the grate actly is; as well as of the manner of making it slightly narrow, which will prevent the possibili- I have seen it made very often by Germans, and it is by them called cider royal; and by putting sassafras, or any thing else to flavour it, I am certhe fibres to be injured; and as it is almost impos- tain would injure it; the way I have seen it made

To make Cider Royal.

Take a clean well hooped cask, and burn a sulthrough. It is felly to say a grate cannot be well ces head-ache; others put but three gallons of bran- bed.

, and from ten to twelve pounds of sugar to it. is, if properly made, and of good cider, a fine d with water; and in the German Counties of ennsylvania, it was the favourite drink, when they got any refreshment at taverns, by all those persons who could not afford to get wine. Those persons that I knew most famous for making good cider royal, put rye whiskey to it instead of brandy, as it sooner became assimilated to the cider and vinous than brandy,; that is, it was not to be tasted, when brandy, could always be discovered by a nice palate. Brandy put to cider or wine after it is well fermented, never loses its flavour in either cider or wine, and instead of becoming vinous, as it ought to be, by fermentation, it is only branded cider, or what used to be called, some 30 or 40 years ago, Sampson; which was one gill of brandy or other spirits, put to a tankard of cider, which always produced head aches.

You also, in the last Farmer, make mention of the naked Barley-I remember it for at least fifty years, and it was used by the German farmers of a part of York County, Pennsylvania, and Frede ick County, Maryland, to make coffee of; and I recollect of hearing it spoken of as infinitely superior to Rye, as to its flavour and salubrity-But I do not recollect of seeing any of it for upwards of thirty years; but formerly I have seen it brought to York Town, Pennsylvania, and Frederick Town, Maryland, for sale by the name of Coffeet Barley-The Germans call it " Coffedgerst."

To make Barley Coffee.

Roast it in the manner that common coffee is roasted, then take one portion of coffee to about as much as one third of the quantity you commonly use for one meal; then take three times that quantity of the roasted barley whole (not being ground) and boil it by itself, then strain it through a tin strainer, with smaller holes than a cullinder; put that liquor over the first portion of coffee and make it in the usual manner.

I knew a very respectable Clergyman, who was fond of some of the good things of this world; that for several years, I was acquainted in his family, always used his coffee made in the above manner-and he used it, because he thought it

an improvement on foreign coffee.

P. S .- I have called on a German's son, now middle aged, who says he has often assisted his father in making Cider Royal, and he says, that my receipt for making it, is correct. His father was famous for making good cider royal of the best quality. He himself, attempted this last year to make one barrel of it, and it turns out to be as hard as the hardest cider. He spoke to a person who makes good cider, one whom he could depend on, and gave him an extra price: the cider was made early in the morning, and brought to him before 9 o'clock; he immediately drew off some of the cider, and put to it ten pounds of sugar, and four gallons of apple brandy, and bunged it up tight immediately. He attributes the hardness to a fermentation having taken place before the sugar and brandy was put to it, instead of the sugar and brandy being put in the cask first.

-0-FOR THE AMERICAN FARMER. CELLERY.

DEAR SIR,

I have just read the remark in your paper on raising cellery; and set down to give you an account of the arrangement of his plants, when finally planted out, by one of the best regular scientific and practical gardeners I ever knew; his arrangements were such, that I never saw a vacant space in his garden; as one article was marketing, another was coming forward in the same

The manner of earthing them up was to place two planks edgeways across the bed, and between two adjoining rows, and putting the earth between the plants.

With respect I remain, Your obedient servant,

Thus you may extend your bed to any length.

DRAINING AND RECLAIMING THE VAL DI CHIANA, NEAR CORTONA, IN ITA-

"The Knights of St. Stephen have conquered a large part of this vale from the river Chiana, an immense morass. The method which they floods, and converted into the richest arable. By this enterprise has the Religion of St. Stephen deservedly become the first proprietor of the plain; while the lands immediately round Cortona count more masters than any Township in Tuscany."

Forsythe's Remarks on Italy, 100.

Note.-After a salt marsh has been completely. diked in, and inclosed from the inundations of the tide, according to the method described by A Chotanter, in No. 31, Vol. 2, of this paper, it might porcelain clay, are desirous of obtaining some often during the winter, and in the summer too, when not charged with a crop, have its surface with nine rows of cellery, about six inches apart coated over, elevated and fertilized by this Italian Colmata. There are few salt marshes so seper enclosed plan*: by this method, a bed fifty cluded as not to admit of being covered by the formation, the following enquiries are respectfulmuddy streams, from the adjacent hills. The medred plants; they took less ground, less manure, thod of pouring on the turbid current, when reand one third only of the necessary covering in quired, and of preventing its escape for a while winter, that the single rows would; and if water-through the tide trunk, must be so obvious, as to to wares? ing was necessary, once passing by the side with a need no explanation. Three or four Colmata, during the winter, would add as many inches of ele for three rows; so what was sufficient for three vation to its surface, besides the additional soli- and can persons be procured in this country, who

TO THE EDITOR OF THE AMERICAN FARMER.

A Virginia Farmer, in No. 47, Vel. 3d. of your paper, asks for information on the best course to be pursued to prevent hogs from being infested FROM POULSON'S AMERICAN DAILY ADVERTISER with vermin, and how to destroy the vermin after hogs are infested. In answer to this inquiry will state, for his information, a method which I have practised with success in removing vermin from hogs. It is, to tar them. The operation is tar on each hog, on different parts of the body .hogs are tarred-and the tarring should be repeated for a fortnight or three weeks, as often as once a week, so as to destroy the young vermin which time of tarring them. The first and perhaps second thought advisable.

Will you or some of your numerous correspondents, inform us of the best method of removing vermin from cattle, sheep, mules and horses-my sheep and cattle are very badly infested with them at this time. They are an insect of not the twentieth part the size of those that infest hogs, but infinitely more numerous, and when a sheep or cow becomes infested by them, it is almost impossible to keep them alive through the winter.

A North Carolina Farmer.

>0< RUTA BAGA,

CULTIVATED AS A SECOND CROP.

Albany, N. York, 4th January, 1823.

DEAR SIR,

My improvement in the ruta baga culture consists in growing them as a second croft, upon a clover lay. The grass is cut about the 15th or 20th of June. If I have manure, and the scrapings of which, being subject to floods, had formed here my yards will always afford me a few loads, I employed, is called a Colmata, and seems to have an acre. The ground is then immediately plough take about a dozen carts full and spread it upon been known in the Antonine reigns. It consisted ed well, one pound of seed sown broadcast per here of an enclosure of stupendous dikes, which acre, and harrowed in with a light harrow, lengthreceived the inundations, and confined them for a wise of the furrow. A single thinning and cleanwhile on the morass. When the river had fallen, ing with the hoe, is all the further attention I give this water was sluiced off into its channel; but, them, until they are drawn in November. My during its stagnation on the surface enclosed, it first experiment gave me a product of six hunhad left there a deposite of excellent earth; and dred bushels. They should be thinned to a disa succession of such deposites has given solidity tance of eight or twelve inches; and for this operate the bog, raised it above the level of ordinary ration a skim hoe of the required width has a deration a skim hoe of the required width has a decided preference over the common hoe. The stubble and roots of the clover decompose rapidly, afford nutriment and moisture, and render the soil friable and light.

I am, dear sir yours, &c.

JOHN S. SKINNER, ESQ. J. B***. PORCELAIN CLAY.

The proprietors of an extensive bed of what competent judges have pronounced to be genuine particular information concerning the same. Under the belief, that either the editor of the American Farmer himself, or some of his intelligent correspondents, can furnish the desired iny submitted.

Is there at this time, in the United States, a manufactory for converting this kind of clay in-

What would be the probable cost of such an establishment-the expenses in carrying it onunderstand the business?

Answers to these enquiries, as well as any other information connected with the subject, will be thankfully received.

Rowan County, (N. C.) 28th January, 1823.

0

In answer to this inquiry MODE OF BURNING CLAY FOR MA-NURE, AND WARMING A HOUSE AT THE SAME TIME, VIZ:

Take a quantity of clay, as many cart loads as performed by taking a small mop, and rubbing the is wanted, and make it, with the addition of water, to the same consistence as that used for The lice will leave the hogs and crawl into the bricks; only there is no occasion of mixing any straw or leaves where the hogs sleep. These loam with it; and for the sake of having the clay beds should be burnt two or three days after the in a convient form, a mould may be made the same width as a brick mould, and half the length; then fill this mould half full of the worked clay, and put a handful of spent Tanners' bark or small will be hatched from the knits on the hogs, at the chips, over the clay, and fill the mould full, so that the clay will be over and under the tan, or time, to add a little brimstone to the tar is chips; and when dry it is fit for the fire; in this way the tan or chips, when the clay is heated red hot, become combined or converted into soot, which makes a fine manure for cold clay lands .-The grates used for burning Lehigh or Schuylkill coal, would be admirably adapted for this mode of burning clay, as they have a strong draught, especially when the blower is put on; and there is no occasion for more coal than is just sufficient to completely destroy its adhesiveness.

It is presumed this mode of burning clay would very much diminish the expense of coal, and a boy could make it up in the form proposed .-Count Rumford recommended using clay, incorporated with charcoal, and formed into balls, for fuel; but charcoal is expensive, and tan may be got very low in the Summer season, though dry

weeds, or chips, are as good.

A Lover of Improvements.

Philadelphia, January 23d, 1823.

WILD SHEEP OF NORTH AMERICA.

We have been favoured with a specimen of the wool of the Ovis Montana Americana, brought from the Rocky Mountains, near the sources of the Missouri and Columbia rivers. This wool, in fineness, softness, and delicacy, resembles that of the Cashmere goat, from which the beautiful shawls of that name are made. We learn on the authority of a gentleman, who has traversed the Rocky Mountains from the north branch of the Columbia to the Athapescow, that numerous flocks of these sheep inhabit that region. No doubt is entertained that this animal may be domesticated, and its fleece wrought into fabrics, which will rival in richness and beauty, the farfamed productions of the east. The French government have recently imported several hundreds of Cashmere goats from their native region, which thrive well in France, and promise to be

FARMER'S NOTICE.

Keep your children at school if possible, and PUBLISHED IN THE AMERICAN FARMER, BY ORtake care not to find fault against the school-master in their presence. Some people are always complaining of the school master or mistress. Let the school be ever so well kept they will be dissatisfied. If your children complain, ten chan-livered from the Queen Anne Inspection Ware-Turkeys, 75 cts. to \$1—Geese, 37½ to 50 cts. ces to one they are in the wrong; and should you house, during the quarter commencing on the Chickens, \$2 per doz.—Straw, \$10 per ton wish to injure them, you cannot do it more effectually than to join with them against their mas-

It is time you should get wood for the coming year. Have your sled in good order; and improve the sledding when you have it. Keep your cattle well-it is a poor plan that some farmers have, of starving their cattle in order to sell hay in the spring. Have you not an old horse which is not worth keeping? Do not let another winter find him on your hands: give him to the crows.

It would be well to see about getting a good supply of fencing stuff. There is nothing that shows the thrifty farmer to better advantage than his fences. If your fences are poor, you hazard the loss of all your crops.

Is your threshing done? If so, you can spend those days which are stormy, still to advantage. Get all your farming tools in order-your yokes, bows, ax helves, shovels, carts, &c. &c. A good farmer will not find much idle time. Remember that the hand of diligence defeateth want; prosperity and success are the industrious man's attendants.

EXTRAORDINARY CALF.

Pippins that are sent to England, which are half any sort. If you want the tree tall and large, See paragraphs 289 to 296. In this country the lost by rot, while the remainder are poor taste- the stock should come from the small black current requires shade in summer. If exposed

it can, from mere curiosity only be thought worth raising at all, and especially at great trouble.

308. FILBERD - This is a sort of Nut oblong in shape, very thin in the shell, and in flavour as under favourable circumstances, reach the height of thirty feet. I never saw any Filberd trees in this country, except those that I sent from England in 1800. They were six in number, and they are now growing in the garden of the late Mr. James Paul, of Lower Dublin Township, in Philadelphia county. I saw them in 1817, when they were, I should suppose, about 20 feet high. They had always borne, I was told, very large quantities, never failing. Perhaps five or six bushels a year, measured in the husk, a produce very seldom witnessed in England; so that, there is no doubt that the climate is extremely favourable to them. Indeed to what, that is good for man, is it not favourable ?- The Filberd is pro pagated from layers or from suckers, of which latter it sends forth great abundance. The layers are treated like other layers (See Paragraph 276), and they very soon become trees. The suckers are also treated like other suckers. (See Paragraph 277); but layers are preferable, for the reasons before stated.—This tree cannot be propagated from seed to bear Filberds. The seed, if sown, will produce trees; but, those trees will bear poor thick-shelled nuts, except it be by mere accident. It is useful to know how to pre-serve the fruit; for it is very pleasant to have it in the habit of raising grapes in their gardens, all the winter long. Always let the filberds may obtain some information as to the means of hang on the tree till quite ripe, and that is ascertained by their coming out of the husk without sect which has of late years attacked the vines, any effort. They are then brown, and the butt and destroyed the promise of their early growth ends of them white. Lay them in the sun for a and the fair appearance of their fruit. day to dry; then put them in a box, or jar, or I would, therefore, plant a row of them as near well as the nut wood, which is, in England, called small mallet. hazle, and is a very good wood. In the oakwoods there, hazle is very frequently the underto various other purposes. I cannot dismiss this with the rows wide enough apart to permit them article without exhorting the American farmer to be weeded with a narrow hoe; or, they may branches, and cover them as usual. to provide himself with some of this sort of tree, be put in the first instance, where they are to be which, when small, is easily conveyed to any distance in winter, and got ready to plant out in six, or seven feet, or more according to the wishthe spring. Those that are growing at Mr. es of the cultivator. In this latter case there PAUL's were dug up, in England, in January, should be three cuttings put into each spot six shipped to New York, carried on the top of the inches apart, to insure the setting of one. When stage, in the dead of winter to Busleton, kept in this is ascertained with certainty, the two weak-a cellar till spring, and then planted out. These est may be withdrawn, leaving the rest of the were the first trees of the kind, as far as I have three to grow. If the cuttings be of one eye been able to learn, that ever found their way to each, they should be from the last year's growth this country. I hear that Mr. STEPHEN GER- and a small piece of the branch an inch long RARD takes to himself the act of first introduction, from France. But, I must deny him this. He, I am told, brought his trees several years later than I sent mine.

and no one that is not good. The shrub is pro-

I laid in the ground sloping, leaving one eye level quantities of fine fruit as this country produces, cannot tell the cause that it is so little cultivated with, or only just above the surface. They should in America. I should think (though I am by no be kept moist, but not wet, as this will rot them. means sure of the fact) that it would do very well A spot which receives the morning sun till eleven under the shade of a South Fence. However, o'clock, and not afterwards, is the best for a nuras far as the fruit is useful in its green state, for tarts sery bed for them, but for permanency they much superior to the common nut as a Water-the Rhubarb supplies its place very well. The fruit should be planted where they will receive the melon is to a pumpkin. The American nut tree is is excellent when well raised. They have goose-sun longest, and in this case they should be a drawf shrub. The filberd is a tall one, and will, berries in England nearly as large as pigeon's shaded at noon day until they have entirely put eggs, and the crops that the trees bear are pro- out. One bud only should be allowed to push digious. (To be Continued.)

> Communicated for the Massachusetts Agricultural Repository by a Horticulturist.

ON THE CULTURE OF GRAPE VINES.

Many gentlemen in this neighbourhood have iven considerable attention to the cultivation of Grapes in the open air upon open trellises, and some have succeeded remarkably well, although they have had to contend with the many difficulties, which that delicate and delicious fruit is subject to in this climate.

Having given some personal attention to this fruit for several years, I am satisfied that it can be raised in great perfection, and with little trouble to the cultivator, if he set out right in better state it will be in the succeeding spring. the first instance, and follow up the system prescribed, with attention and care.

Although most men, who have any knowledge in Horticulture, know more or less respecting the mode of cultivating this plant,-yet there are many new beginners, who may collect some hints from these notes, which may aid them in the outset; and many gentlemen, who have been long Always let the filberds may obtain some information as to the means of

The best treatises on the subject of raising barrel, with very fine dry sand. Four times as grape vines, recommend planting the cuttings in much sand as filberds, and put them in any dry pots,—but in this country it is entirely unnecesplace. Here they will keep well till April or sary, as the plants may be easily raised in the place. Here they will keep well till April or May; and, perhaps, longer. This is better a great deal than putting them, as they do in Engand, into jars, and the jars into a cellar; or if they do fruits, one, which in sickness, as well as in health, not mould in that situation, they lose much of their is the most refreshing and nutritive of any that sweetness in a few months.—The burning sun is we possess, with little expense and even with apt to scorch up the leaves of the Filberd tree. profit to the cultivator, we shall do a great good.

The best mode of raising the plants is by cutas possible to the South fence. Ten trees at eight tings taken from the vines at the Fall pruning, do very well under the shade of lofty trees, if those be made either of one eye or bud or of four or These may

The 1st year .- They may be raised in a small nursery bed, prepared of a good light soil-set in reared, and left to grow, at the distance of five, should be left attached to the bud and extending half an inch on each side of it.-These should be planted two inches below the surface with the bud uppermost, and a small stake placed by the 309. GOOSEBERRY .- Various are the sorts, side of them that they may not be disturbed. the cuttings are of several eyes, they should be it grows.

from the cutting the first year; the plant should be kept free from weeds; the earth kept light around it, and as soon as the shoot has attained strength enough to produce laterals, they should be rubbed out, and the shoot tied to a small stake, by which means it will gain firmness, and the admission of the sun and air to the shoot will prepare it to bear the frost of the Fall, and prevent its imbibing the moisture which it would otherwise be subject to, when covered with earth in the winter. By the 1st Nov. the shoots may be cut down to two eyes, and by the middle of the month, if it be dry weather, they may be covered over with earth, forming a slope to cast off the wet and prevent the rains from penetrating- as the drier the plant is kept during the winter, in the

The 2d year,—The plants should not be uncovered in this climate till the middle of April,— Those from the nursery should now be transplanted to the places where they are to remain; a shoot from each eye should be permitted to push, but as soon as you have ascertained which of the two will be the strongest and the best situated, you will preserve that, and rub out the other.-The shoot preserved you will be careful to tie up to a small stake as soon as it has length enough for this purpose, to prevent its being broken by the wind or other casualty. During the summer, the laterals from the four or five lowest buds must be rubbed out, and the shoot be carefully protected by being kept tied every eight or ten inches.

The next Fall you may cut this shoot down to two buds, (not counting the one in the crotch of the plant between the old and new wood) and cover over as before.

The 3d year.—You will allow shoots to push from both the eyes, and suffer them to grow, taking care of them as recommended above; but the bud in the crotch must be rubbed out. year you must rub out the laterals from the five lowest buds, and nip in the other laterals to one eye, so that if the plant grows luxuriantly the do very well under the shade of lofty trees, if those be made either of one eye or bud or of four or trees do not stand too thick. And it is by no five, attached to a small portion of the two years not from the buds of the laterals, and means an ugly shrub, while the wood of it is, as old wood, forming a cutting in the shape of a lift the vine was dressed too close. Be careful to keep the branches tied up that they may not be broken. In November, cut down the two branches as follows: the most feeble of the two, to two wood; and it makes small hoops, and is applied the ground six inches distant from each other, buds, to produce wood branches the succeeding season; and the strongest, to three buds, for fruit

The 4th year.—If you keep your vines properly dressed, you may have your first fruits without injury to your plants. After this the system to be pursued must depend on the strength of your vines, and this will depend on the goodness of the soil and the care you take of your plants. But as a general rule, the following points must be attended to.

1st. The number and length of your fruit branches must always depend on the strength of your plant; the wood branches are always to be cut down to two eyes.

2d. No more branches should be left on the vine than it can nourish well, and abundantly; If this will depend on its age, and the soil in which this purpose.

grow than can be laid in clear, and handsome, ened, as is customary on vines not thus treated. and without confusion on the trellis, and so as to

of the eyes bursting in the main shoots. Be care-ounces each. ful always to keep the shoots tied up near their

6th, Never leave more than five good eyes on a fruit bearing branch, unless your vine is confined to a narrow space, and you are obliged to this case the length of the branch must correspond to the nourishment it will receive from the plant. Select the roundest and fairest branches for fruit, and the lowest and most feeble for wood. The closer the buds are together, or the shorter the joints of the branch, the better they are for fruit; these may in general be cut to three, four, or five eyes according to their strength. But in vineries covered with glass, where two fruit bearing branches only are left on strong vines;

twenty, thirty, and forty buds are sometimes left on fruit branches.

The foregoing rules will be sufficient for any one to build up a vineyard sufficiently large to supply himself-his friends, and the market with grapes. But to promote and forward their maturity and size, the following course may be pursued.

The first of July you will be able to see the state of your fruit, which will be just formed .-At this time select the highest fruit branches and those which have the finest appearance of fruit upon them, and perform the following operation on the two years old wood, from which these branches proceeded, taking care not to cut below any of the wood branches.

Take a pruning knife with a smooth edge, and hawk's bill, and pass it round the branch where the bark is clear from knots, cutting deep enough to reach the sap wood of the plant; at a quarter or 3-8ths of an inch below the first cut make another, running parallel with the first; then make a perpendicular cut through this section of the bark the same depth, and you may take out the ring of bark clear from the branch. This will not prevent the sap rising into the upper part of the branch, but it will prevent its descending below this cut, by which means it will be retained in, and distributed throughout the upper part of the branch, in a greater portion than it could otherwise be, and the branch and fruit will both increase in size much more than any of those that are not thus treated, and the maturity of the fruit will be advanced very much.

3d. The branches should be cut in alternately room for the branches which you have been warm, insure a good harvest; if otherwise, you for wood and fruit branches, observing to cut for bringing forward to give you fruit the succeeding wood branches as low down on the plant as posyear. This may be kept up from year to year, sible, so as to renew your wood near the bottom and give you a succession of ripe fruit from the annually. No shoots should be permitted to 1st of Sept. to the close of the season. The fruit grow from the old wood, unless wanted for on those branches which are not girdled will ripen the latest of course, but neither these, nor 4th, No more shoots should be permitted to those which have been girdled, should be short-

Vines that are already attacked by them. this insect to any great degree should be smoked in June, July, and twice in August, or oftener if Pope's Thrashing machine, reportedyou find the insect is not completely destroyed.

The insects are first seen on the under part of the leaf, without wings—very active but easily destroyed if touched. They afterwards assume the winged state, when it is very difficult to get at them, as they fly off on the vines being touched. They are yellow, striped with brown across the back. The moment the smoke ascends, the winged insects quit the leaves and fall to the ground dead or alive; the young ones perish, but the older ones will revive if not destroyed in their torpid state. To effect this, you have only to cover the ground under the tent with a piece of wet cloth before you begin to smoke, to which they will adhere until the tent is removed, and they are revived by the atmospheric air; to This has been denominated Girdling. If the prevent which you will roll, or twist, the cloth plant is very vigorous and the season very favor- each time that you remove the smoke house, or able, the wound will soon be closed, so that it may tent, and replace it again each time before you be necessary to open it a second time. The process does not injure the plant, as you only girdle

The valuable parts wards accurate tillage and plentiful supplies of of most manures, readily assume the gaseous rious animals, must be made, to sanction any manure, as the species of millet usually grown in form-every deep stirring, to a certain extent, general conclusion, as to the comparative effects this and the adjacent counties. I have sown it in hat weather, therefore, impoverishes the soil. Of different sorts of food. I mention the trial from the first of May, to the 20th of June, and Deep ploughing, at proper seasons, is, I conceive with the heifers, but as one of a series of attempts have invariably obtained more fodder than could the basis of all good farming; such crops as shall enable the husbandman to extirpate weeds, and obtain large supplies of fodder, without much to the formation of fat, as to the production of caustic lime per acre, were strewed upon an old exhaustion, should be the great objects for his milk, and the enlargement of size.

[Sward, which was immediately ploughed, closely aim. I would propose that a foul sward receive its proper quantity of quick lime, which should be spread, and ploughed under, in its caustic state, in the early part of September; that the field be harrowed sufficiently; sown with rye at the rate of two bushels per acre, as early as possible-that it be depastured late in the autumn, and early in the spring-that in May, it be again ploughed three inches deeper than before -that it be harrowed, and left until the small weeds begin to appear-early in June, Millet should be sown—in August, the crop can be re-moved after the labours of the general harvest. The field should be slightly stirred with the scarifier, occasionally harrowed, and left throughout September, for the destruction of weeds as before. In October it may be manured, and sown with wheat, or left for a crop of Indian I am, &c. your's, JOHN HARE POWELL. Corn.

JONATHAN ROBERTS, Esq.

President of the Penn. Agricultural Society. 200

TO THE EDITOR OF THE AMERICAN FARMER,

ON THE PEA-AS CULTIVATED IN NORTH CAROLINA.

Spring Hill, Lenoir County, North Carolina, May 8th, 1821.

Agreeably to your request I forward you, this day, thirty peas of each of the three different peas in a basket on his arm, follows the plough, and with a pipe bowl or end of the neck of a gourd in the other hand, dips the peas out of the far the best way if the land will admit it to be with them the better. done, as then the peas come up on a ridge, and I am promised, by an lier than the tory. I plant the pea principally so much used on board their vessels. for fattening hogs, cattle and sheep, which are ed, and eat off the peas at their pleasure, and this saves me the trouble of gathering the peas, stock, could we gather it and feed it away with regularity to them. But our cotton crop requires to be gathered at the same time with our peas and corn, and therefore we find it best only to ake the time necessary for saving our seed peas in those districts of our country, where we go upon raising pork for market, which is the case in my neighbourhood, but on the Roanoak where totton does not do so well, and lower down the country, they pick large quantities of peas for ale, which are generally shipped from or con-LETTER FIRST—FROM A FATHER TO sumed at our sea ports, before this season of the year; and therefore I fear I shall hardly be able get the few bushels you want to experiment pon in the broad cast way, for improving wornut lands as a substitute for clover. HIS SON.

" A father blest with an ingenuous Son-Father, and friend, and tutor, all in one."

pare no pains in my endeavours to have two or child, have manifested a strong partiality for agpare, appreciate, adopt or reject—none are con-hree barrels of the peas sent to you; William riculture, I am now induced to address a few let-Dun of Newbern, and Abner P. Neale of Washington, both merchants, are the gentlemen I shall ture conduct in life, in order that you may not be pply to, to send you the peas. Plant those I send left entirely destitute of a father's advice, should

ifference. In the western parts of this state I ficiency of youth, and to observe, how much In order that you may form a more correct idea resume the pea does not do well, as they do not more pleasing boys would appear, were they to of cultivating a farm on a regular system, I will

do among our corn. The pea dropper, with the fruit, which probably is the case in our western attention, in a particular manner, to this subject, and to urge you to guard against acquiring a habit In sowing broad cast for manuring, I would sow of expressing yourself with an air of self-suffici-

Accustom yourself to active and industrious by the last furrow covers the peas, which is by to them, for the more weeds and grass grows acquainted with-prefer being alone, to spending your leisure time; with the idle and dissolute; I am promised, by an acquaintance, a few peas pursue wisdom with all your might, reading are not so apt to be washed up by heavy rains of an earlier kind than either of those I send much, but selecting such books, only, as will add between the 20th of May and the 20th of June, you; should I get them in time I will forward you much to your stock of sterling knowledge, and between the 20th of May and the 20th of June, the time within which we wish to get our peas all planted. This is the way where we do not ridge up our land as advised by Arator; where that is done, we open a hole on the ridge between the corn with a hoe, drop the peas in it and cover with the foot or hoe—you will probably think it stange that we put so many peas in a hill, but be assured it is correct, and we cut down the beassured it is correct, and we cut down the court needs of the particularly attentive to your religious duties, always bearing in mind, that the self-conceited infidels, of the present day, have not found even a substitute for the bible—strive to do your "duty towards God, and your duty towards your neighbour, we save them for hay; cattle, horses and bour, and to do unto all men, as you would, they sheep, eat them greedily; in fact, they eat the should do unto you;" by this course you may learn what constitutes real honor, justice, honesty, truth disinterestedness, generosity, humanity, and gourd neck, or fill the bottom of the pipe bowl, through, particularly in moist weather. Sheep truth, disinterestedness, generosity, humanity, and till we find that on dipping into the basket to fill are fonder of the hay made of the pea vine, cut all those virtuous qualities that constitute the re-

a neap, as can well be done, as the hand walks along the row without stooping. After the peas are planted, we generally plough the corn altogether the other way. But in this way, among your corn, I do not think the pea would ripen before frost, but planted by themselves in a patch. I have said much more already on the sub-subjects, endeavour to regulate your conduct by them, and do not let the opinion of the world, to read, but still not enough to give you a full idea of its importance to the farmer in the level you from that line of steady industrious, and honographed to give you a full idea of its importance to the farmer in the level you from that line of steady industrious, and honographed to give you a full idea of its importance to the farmer in the level you from that line of steady industrious, and honographed to give you a full idea of its importance to the farmer in the level you from that line of steady industrious, and honographed to give you a full idea of its importance to the farmer in the level you from that line of steady industrious, and honographed to give you a full idea of its importance to the farmer in the level you from that line of steady industrious, and honographed to give you a full idea of its importance to the farmer in the level you from that line of steady industrious, and honographed to give you a full idea of its importance to the farmer in the level you from that line of steady industrious, and honographed to give you a full interest. I have no doubt our earlier kinds would come to perfection. Of the kinds I send you, the black pea is nearly a fortnight earlier than either of the others, which ripen nearly at the same time; if any difference, I think the corn pea rather earlier than the toy. I then t will Liam BLACKLEDGE.

FOR THE AMERICAN FARMER.

Virginia, February 14th.

MR. SKINNER, The symptoms of a revival in the long laid pirit of the turf, together with several pieces, which have appeared in the publick prints, upon the improvement of our stock of horses, setting forth erroneous views of the subject, as I conceive, will be my apology for troubling you with the following remarks, for the American Farmer, should you deem them worthy a place in its columns.

Perhaps the novelty of the opinion, that the taste and passion for racing so far from contributing to, has retarded the progress of improvement in our horses, may attract some curiosity ;-but, when it is stated further, to be an opinion deliberately formed, upon an experience of twenty perfection of the species, I may hope for a patient from the premises, if it were not established by

reading, from all whose minds are open to convic-

The essential points of the English turf horse, are, a thin and deep shoulder, narrow breast, delicate clean legs, long in the pasterns, a broad or wide hock well let down, and a thigh or haunch more remarkable for length than bulk. A long back more common than a short one, and a body oftener flat sided than round-and, finally, the taller the better, but not less than sixteen hands, for a first rate courser. This carcase and set of limbs is covered by a skin so thin and a coat of hair so fine, as to express the very veins as well as the muscles, beneath the delicate integument.

A long, low, slouching carriage, in every gait, follows as a consequence of the above form and proportions.-The very best calculated, truly, for a four mile heat, on a smooth course, but that it is totally unsuited to the road, I will use year's breeding, commenced under the full im-pression, that the English race horse was the sagacious readers will have deduced already

in our climate, and manifestly for the better, as to every rational and useful purpose. The native Virginia horse of the third and fourth generation, from the light and washy figures of the furest English stock, become less tall, with more bulk shorter and stronger jointed, with a thicker and coarser coat; with these changes, there is a correspondent one in gaits and carriage. They oase in England.

Equally disqualified by the nature of his skin, with an eye to qualities for service, rather than the experiment, the success of which I underis he for the harness—the slightest pressure the worse than useless properties for the turf, take to warrant. producing a gall—and as unsuited are his long Virginia would now have had the most valuable Pohic legs and limber pasterns to the frequently deep race of horses in the world; but, unfortunately, state, and irregular surface of our roads, that a horse of compact form and nimble movements, Colonel Hoomes, of the Bowling Green, of well with a strong coat on his back and shoulders, and known racing memory, and many others, availnot within a hand of his height, will always be ing themselves of the passion for racing, inunfound more lasting and serviceable. Moreover, dated the state with imported English race hor-the running stock are frequently vicious and un ses, well nigh to the extinction of the good old manageable, and very generally so shy and timid, stocks of Janus, and Fearnaught, and Jolly Roger, manageaute, and very generally so say and clinic, as to render them in a great degree unfit for the and Mark Anthony, and Selim, and Peacock, purposes of war.—In England, the horses of this strain, are rarely used, but to contribute to the most ruinous and expensive of their pleasures*—In horse has a late become a general remark; and and I am strongly inclined to the opinion, that when you do find one, with the exception of now and I am strongly inclined to the opinion, that when you do find one, with the exception of now the highest style of the English race horse, which, it has been a very prevalent folly with us to take as our model, is a forced anomaly in the species, introduced and propagated by a prodigility of attention and expense, such as the Buzzard, and Dare Devil, and Oscar, and Salgulty of attention and expense, such as the enormous wealth of the nobility of England is trum, and twenty others which might be added. are either extinct or still languishing through the The noble animal to be cherished as the com- probationary term of over pampered exotickspanion of our manly pleasures and glorious such as have the stamina to go through the trial achievements, should be of the form for power, and become naturalized to corn and fodder in docile and courageous in his temper, quick, hrm log stables, may form the basis of some future and clear in his movements. These properties good stock; but, I dare say, we shall never hear are found for the most part connected with roundness of contour and strength of articulation; with perhaps, have had more experience than the aua texture of skin and strength of coat, which will thor of this communication; having laboured unbear the pressure of the saddle and the friction der the racing mania for a term of years, that of the harness; and as far as my experience has almost reduced him to a race of worthless gargone, it is rare, that you find a horse of this rans, though none of their distinguished dams description exceeding fifteen hands and a half cost him less than a hundred guineas a piece, and high. All the finest horses in the world, may be were certified for, through an uncontaminated traced to the Arabian stock. The English race horse is of Arabian descent, with the peculiar objections above described, but which I am about twelve years ago, I became convinced of happy in believing, the Author of Nature has my delusion, and since I have been endeavouring kinely decreed shall never be made indigenous to to get back to the well known old stocks, and our soil and climate.—The English blooded stocks, the soil and uncrossed, essentially change their characters after a few generations hopes.

One of your constant readers with a full share of Virginia fondness for horses.

>0 FOR THE AMERICAN FARMER.

RATS.

In the year 1817, the rats were so numerous are more active and sprightly in their movements, in my stable and carriage house, as to defy cats and better able to stand the vicissitudes of our and traps, I was therefore compelled to try the climate. Our food, our climate, and our man-effects of powder and shot, which was continued agement are quite sufficient to account for these for several days without perceiving any great dichanges. Our maize, which forms three forths minution of them, but to my surprise in fifteen or of the grain fed to our horses, in the parts of the twenty days, not a rat was to be seen, and my state below the mountains, (where cur best hostler assured me he has not seen one since. In horses are found), is by far more nutricious than the year 1819, my barn, two miles from my house, the oats of Europe, or any other grain used for the became so much infested by them, that my over-

the known general rule, that "a race horse is a turalized—and I have but little doubt had we pro-ceeded upon the rational plan of breeding solely By publishing this, it may induce others to try

FACTS RESPECTING CANALS.

The longest canal in Europe, is that of Languedoc, which connects the Atlantic Ocean with the Mediterranean. It is 192 miles long, and was began in 1666, and completed in 1680. The expense was 13,000,000 of livres equal to about ,400,000 dollars. Louis XIV. the reigning monarch, contributed 5,000,000 of livres, and the province of Languedoc the remainder.

The name of the architect was Riguet, who, as a reward of his merit and talents, was presented by the king with his quarter of the profits for himself and his heirs.

The reservoir with which it commences, is 24 feet deep and 4000 paces in circumference and is supplied by a number of springs from the Noire, and rivulets.

This canal has 104 locks, of about eight feet rise each. In some places it passes over bridges of vast height; and in others it is cut through solid rocks for one thousand paces.*

" From the year 1758 to 1803, it is estimated there were nearly 60,000,000 of dollars expended on canals in Great B itain; the whole subscribed by private individuals. The length of ground which they occupy is 2896 miles. In this aggregate of length and expense, 43 canals, being private property, are not included, among which are three of the Duke of Bridgewater, Sir Nigel Boyer Grisley, and the Earl of Thanet. Of the acts passed for canals, ninety were on account of collieries opened in their vicinity; and fortyseven on account of mines of iron, lead, and cop-per, and for the convenience of furnaces and

forges working on them.
"Eight of these furnaces, and twelve of these forges, in one county only, worked 24,824 tons of iron ore, and consumed 12,324 tons of pit coal annually; manufacturing in the same time 13,104 tons of iron goods. More than 100,000 tons of pit coal are annually taken down the Severn, for the Madely and Brozely Mineries, to the towns and villages in the neighborhood."

When the bark than any other single cause.

few hours, which, while it renders the wood incombustible, completely prevents the dry rot.

The solution of pure vegetable alkali which Mr. Cook prepares for securing from fire muslins, cottons, &c. &c. is as pure as the clearest spring water, perfectly free from smell, and will not discolour the finest cambrics or muslins. When so many dreadful accidents are continually happening from ladies' dresses taking fire, from bed and window curtains being set on fire either by accident or carelessness of servants, we cannot but consider this discovery as one of great importance to society.

For ship timbers, its value is enestimable, and not less so for all timber for houses and public

buildings.

USEFUL INVENTION.

Mr. Edward Jakes, an English surgeon, has invented an apparatus by which the stomach may be emptied of poisons, that have been taken by accident or design. In cases where that organ has become unsusceptible to the action of emetic the Vine, from the Massachusetts Agricultural substances, the skilful application of this instru-ment will not fail to rescue the sufferer from im-Swift in a late essay, and is worthy of attentive pending destruction. Mr. J. has tested the effica-

An Ohio farmer recommends coals, as useful in fattening hogs. After giving his hogs a small to be much larger than the fox grape, of golden quantity daily, say two pieces to each, about the size of a hen's egg, they discontinued rooting, fruit—the skin transparent and thin, as the outer were more quiet, and appeared to fatten faster, coat of the Onion, and the fruit growing not in He omitted the coal a few days and they com-bunches, but separately—such is the description menced rooting; he gave it again and they ceased to root. He supposes that the coal corrects subscriber in that quarter who would give us a that morbid fluid in the stomach which incites more particular account of it, with cuttings, them to root deep in search of fresh earth.

> FROM THE COMMERCIAL ADVERTISER. THE PILOT'S SONG.

>04

O'er the ocean silently Descends the gentle shade of even ; The moon has risen from the sea, Into the broad, and the deep blue heaven; And from her airy wandering, Like a falling flake of snow, The sea-bird rests her wearied wing On the billow's quiet flow.

Yet ere the day beam left the skies, And twilight veil'd the ocean o'er, We saw from you blue billow rise, Far, far and faint, our native shore; How throbb'd each bosom at the sound-The exulting sea-boy's shout above, As far, upon the wide waves bound, Burst into sight the land we love!

Athwart the wave, the beacon light Shoots brightly forth its twinkling ray, And sweetly onward thro' the night, Its star-like lustre lights our way; The heavens are bright, the wave is low, And mild winds gently bear us o'er The azure waste-with morning's glow We tread again our native shore

FOR SALE

At Tuscarora on Carrolton manor near Frederick Town; the late farm of Robert Patterson, Esq. deceased, a variety of stock of the first quality and character, such as never was before offered at a public sale in Maryland; consist-

ing of The imported horse Exile, a description of which will be found below.

27 head of horses for draught and saddle.

1 female ass.

14 brood mares, principally of the Jersey blood. 19 colts, rising one to four years old, princi-pally by Exile, and possessing strong marks of the sire.

1 waggon of narrow tyre.

ox cart.

horse cart, and harness complete.

4 yoke of fine oxen.

A quantity of milch cows. A quantity of stock cattle. A flock of sheep.

A wheat fan.

Two families, containing together ten persons, they will be sold in families, and not to be taken out of the state. They are orderly, and valuable people, and are not disposed of from any fault.

The sale will take place on Tuesday the 25th day of March next, and will begin at 10 o'clock in the forenoon. The condition of the sale will be made known by me at the time of selling, and the stock may be seen by an application to me, at any time before the day of sale, living on the premises.

Tuscarora, 23d Feb. 1823.

EXILE is a beautiful dark bay, sixteen hands high, will be four years old in May. He is admitted by the best judges who have examined him, to be the finest description of horse, ever imported into this country, as well on account of his breed, as his great bone and figure. The sire of Exile is considered one of the most splendid coach horses in England; his grand sire is the famous Yorkshire horse Mollineaux, which sold for 1100 guineas. It is the mixture of the Cleveland Bay, with the racing blood, which produces the old English Hunter; and it is the cross from them, that makes the Jersey horse more valuable than the southern; giving them bone, size, and high round action. The colour of these horses is confined to the various shades of bay, always with brown muzzles; and they combine the fine rope, that this breed only can increase the size of the blooded horse, without taking from their activity, wind and figure.

AGENTS FOR THE AMERICAN FARMER.

CHAPTER V.

FRUITS. Propagation, Planting, Cultivation.

LIST OF FRUITS.

310. GRAPE.-This is a very important article; and, before I proceed to treat of the culture of the grape-vine, I must notice the astonishing of fine grapes hanging down in large bunches .of lofty trees; the country in general, being very much covered with woods. Mr. LE GAU made wine from this Vineyard. The vines were plantin the negative of the proposition, that there is a

circumstance, that that culture should be almost grape-vine in the open ground of a garden; and, within an inch or two of each other, leaving only and on the side of another little hill, was a wood the first summer, and will become a vine, to be and, as they proceed on, they must be tied with generally prevalent obstacle to the growing of for my garden. Plate I. page represents, or ever comes on a grape-vine, except on young grapes in this country?—Mr. Hulme, in his at least, I mean it to represent, on the south side shoots that come out of wood of the last year.—Journal to the West (See my Year's Residence, of the Plats No. 8 and No. 9, two trelis works All the four last year's shoots that you find in fig. 2. Paragraph 892,) gives an account of the Vine- for vines. These are to be five feet high, and would send out bearers; but if you suffer that yards and of the wine made, at Vevay, on the are to consist of two rows of little upright bars you will have a great parcel of small wood, and OHIO. He says, that, that year, about five two inches and a half by two inches, put two feet little or no fruit next year. Therefore, cut off 4

which exhibits, in all its dimensions, the cutting hing, Fig. 2. The same year's vine fruned in you are to cut off the four shoots that sent out become a flant, Fig. 1. The first year of its bearing a vine after the leaves are off and before fru- with shoots, leaves, and grapes, Fig. 4. Hav four that grew out of the butts. Cut the four

THE AMERICAN GARDENER, chicken grapes, hanging on it from every boughting measured your distances, put in a cutting at of an oak or some other timber-tree! This grape each place where there is to be a vine. You are resembles, as nearly as possible, what is, in Eng-to leave two joints or buds out of ground. From land, called the Black Cluster; and, unquestion-these will come two shoots perhaps; and, if two ably only wants cultivation to give it as good a come, rub off the top one and leave the botflavour. Does the Rose Bug prevent these vines tom one, and, in winter, cut off the bit of dead from bearing, or from ripening their fruit? Tawood which will, in this case, stand above the king it for granted, then, that this obstacle is bottom shoot. Choose, however, the upper one imaginary, rather than real, I shall now proceed to remain, if the lower one be very weak. Or, to speak of the propagation and cultivation of the a better way is, to put in two or three cuttings wholly unknown in this country, of fine sun. I in doing this, I shall have frequently to refer to one bud to each out of ground, and taking away, have asked the reason of this, seeing that the PLATE III.—The grape vine is raised from cut-in the fall, the cuttings that send up the weakest have asked the reason of this, seeing that the fruit is so good, the crop so certain, and the culture so easy. The only answer that I have received is, that the rose-bug destroys the fruit piece of the last year's wood; that is to say, a piece of the last year's wood; that is to say, a piece of a shoot, which grew during the last sum its full length. When winter comes, cut this court-yard at Philadelphia; that it bore nothing the first year; that I made an arched trelis for it to run over; and that I had hundreds of pounds.—

This cutting should, if convenient, have shoot down to the bud nearest to the ground.—

as early as the grape wine is raised from cut-in the fail, the cuttings that send up the weakest times and up the weakest times are distincted.—

In the fail, the cuttings that send up the weakest times are in the fail, the cuttings that send up the weakest times are distinguished.—

In the fail, the cuttings that send up the weakest times are distinguished in the fail, the cuttings that send up the weakest. ly necessary. The cutting should have four or off, in the fall, this shoot will be eight or ten feet of fine grapes hanging down in large bunches.—Yes, I am told, but this was in a city; and amongst houses, and there the grapes do very well. Then, 1799, I saw, at Spring Mills, on the banks of the Shuylkill, in Pennsylvania, the Vineyard of Mr. Le Gau, which covered about two acres of ground, and the vines of which were loaded with fine grapes of, at least twenty different sorts. The vineyard was on the side of a little hill; on the top of the hill was a cornfield, and in the front of it, across a little valley, and on the side of another little hill, was a wood the first summer, and will become a vine, to be discovered on, they must be tied with great ease. You have only to lay a shoot, or limb, howen and on the side of another little hill, was a wood the first summer, and will become a vine, to be long, in the fall, this shoot will be eight or ten feet five buds or joints. Make the ground rich, five buds or joints. Make the ground rich, five buds in the ground rich, five buds or joints. Make the ground rich, five buds or joints, and will be eight or ten feet long, having been tied to a stake as it rose, and will be eight or ten feet long, having been tied to a stake as it rose, and will be eight or ten feet long, having been tied to a stake as it rose, and will be eight or ten feet long, having been tied to a stake as it rose, and will be eight or ten feet long, having been tied to a stake as it rose, and will be eight or ten feet long, having been tied to a stake as it rose, and will be eight or ten feet long, having been tied to a stake as it rose, and will be eight or ten feet long, having been tied to a stake as it rose, and will be eight or ten feet long, having been tied to a stake as it rose, and will be eight or ten feet long, having been tied to a stake as it rose, and will present value long, having been tied to a stake as it rose carried and planted in any other place. But, ob- matting, or something soft, to the bars. The serve, vines do not transplant well. For this rea- whole vine, both ways included, is supposed to son, both cuttings and layers, if intended to be go 16 feet; but, if your tillage be good, it will go removed, are usually set, or layed, in flower hots much further, and then the ends must be cut off were tied to sticks about five feet high, after the manner of some, at least, of the vineyards of France.—Now, are not these facts alone decisive are intended to grow and produce their fruit.—I which is the all-important part of the business. have now to speak more particularly of the vines Observe, and bear in mind, that little or no fruit Ohio. He says, that, that year, about five thousand gallons of wine were made; and, he observes, what more can be wanted for the grape-vine, than rich land and hot sun.—Besides, is not the grape-vine a native here? There are many different sorts of grapes, that grow in the woods, climb the trees, cover some of them over, and bear and ripen their fruit. How often do we meet with a wine, in the autumn, with grapes called over, and shoots and a half by two inches, put two inches and a half by two inches, put two inches, put two inches and a half by two inches, put two inches and a half by two inches, put two inches and a half by two inches, put two inches and a half by two inches, put two inches and a half by two inches, put two inches and a half by two inches, put two inches and a half by two inches, put two inches and a half by two inches, put two inches and a half by two inches with a vine, in the autumn, with grapes, called overrunning branches.—Look, now at PLATE III about, every half foot, every last year's shoot will produce 32 bunches of grapes; every vine 128 bunches; and the 8 vines 512; and, possibly, nay, probably, so many hounds of grapes! Is this incredible? Take, then, this well known fact, that there is a grape vine, a single vine, with only one stem, in the King of England's Gardens at his palace of Hampton Court, which has, for, perhaps, half a century, produced on an average, annually, a ton of grapes; that is to say 2,240 pounds, Avoirdupois weight. That vine covers a space of about 40 feet in length and 20 in breadth. And your two trelises, being, together, 128 feet long, and 4 deep, would form a space of more than half the dimensions of the vine of Hampton Court. However, suppose you have only a fifth part of what you might have, a hundred bunches of grapes are worth a great deal more than the annual trouble, which is, indeed, very little. Fig. 4 shows a vine in summer.-You see the four shoots bearing, and four other shoots coming on for the next year, from the butts left at the winter pruning, as at b. These four lat-ter you are to tie to the bars as they advance on during the summer .- When winter comes again,

old shoots that have borne, so as to leave but one course, send out shoots, which you will train up-not yet completed its history, but have ascerbud at the butt. And they will then be sending right against the building, and which you will tained, that it has three broods or generations in And thus you go on year after year to pruning. Each of the last year's shoots has 32 buds, and, of course, it sends out 32 shoots with must not be. When the grapes get as big as hear, cut off the green shoots that bear them, at two buds distance from the fruit. This is necessary in order to clear the vine of confusion of branches, and also to keep the sap back for the supply of the fruit. These new shoots, that have the bunches on, must be kept tied to the have the bunches on, must be kept tied to the law off— I am now writing.

better than a rotten apple.

314. MELON.—See Melon in Chapter IV.

315. MULBERRY.—This tree is raised from sample of the Egyptian Millet, mentioned by Mr. Herbemont; but, from his description of it, I am inclined to believe, that it is the same and which the Silk worm feeds on, grows wild, and which the Silk worm feeds on, grows wild, and say substitute for chocolate, and is there called "chocolate corn" and is there called "chocolate corn". have the bunches on, must be kept thed to the trelis, or else the wind would tear them off— lam now writing.

The other thing is to take care to keep nicely 316. NECTARINE.—As to propagation, shoots. As to cultivation of the ground, the fruit preserved, like Filberd, which see. ground should not only be deeply dug in the fall, but, with a fork, two or three times during the doc, as we do between the Indian Corn. ground should be manured every fall, with good John S. Skinner, Esq. rich manure. Blood of any kind is excellent for Dear Sir-In the Ame

for your life; for, as to the vine, it will, if well that it grows wild in great abundance, in many parts, and especially in Long Island, where it the third and even thirtieth generation. I think give rise to a holiday called Huckleberry Monthey say, that the vine at Hampton Court, was day. It is a very good fruit for tarts mixed with second brood in June is lodged above the several

Do we not remember how the blackbirds former-ly followed the plough in search of grubs? Alas! that the deposite is two hundred fold, then the half a day, by a single individual.

The caterpillar and canker worm I need say but little about, as by a little attention the whole million in one year; or if, as is very probable, half a day, by a single individual. it be too late.

I have also mentioned the pea fly, but I will where they had been kept closely covered, into water, and none could escape after being once wet. I think it did not take above fifteen minutes to kill them all.

The peach worm is generated by an insect of something of a wasp-like appearance, and about every part, and therefore each species held its proper rank in the great scale of creation; but stalks of wheat and rye, in spring and fall, and dark or black body, with four narrow rings of yellow around it-some yellow about its mouth; and thorax-wings transparent or little inclining but allow me to make a few remarks as regards assuming a ripe appearance, but producing no small bunch of down at posterior, appearing the insect tribe. It must be obvious to every grain. is of a beautiful purple or mazarine blue, all over except a rich orange stripe about one eighth of an inch broad, extending around the body with a little interruption, under the belly; and the inner edges of the wings appear light or transparent-the body is somewhat shorter, but fuller than that of the male-deposited eggs on The white grub that infests our grounds in the third day after appearing in the winged state, probably owing to its confined situation in a glass Cut worm or black grub, that harbors in the tumbler; the eggs are just discernable by the crops will probably in turn, share the same fate. ground and cuts off the young plants early in the naked eye, are oval and of a dull yellow color, and were attached to the side of the tumbler with a gluey substance, so that I should suppose that Pea fly, that infests our peas.

Curculio, that produces a worm which enters where on the trunk of the peach tree; but this relate, we suffer this lower grade of animals to into several kinds of fruit, and causes the drop-is a matter for further investigation. I have furnished Thomas Say, Esq. with a pair of the insects in living state, and he will give them a proper examination, and if not already noticed by some the rose, and some seasons is destructive to Entomologist, he will furnish a scientific de

The white grub has done great injury this season to our grasses, grains and roots, and has increased within the last several years, to an extent that ought to alarm us. Indeed such is the present number, that should all arrive to the winged state, and bring forth a full progeny, we may calculate that there will be an increase of on the trunk, and sometimes extending to the at least one hundred (and perhaps several hundred) fold, to feed upon our next year's crops, A species of spider or webbing insect that and if the season should prove as dry as the preby this single species of insects.

The curculio might, in a great degree, be destroyed by suffering hogs to pick up the fallen

fruit, in which the larva is lodged.

The rose bug may be destroyed by early atten-tion without much labor: it first attacks the rose, having a preference for it; then, as soon as the bugs are seen to collect upon the rose, takea vessel about half filled with water, (a large The Hessian fly I have already investigated, tin cup is a handy thing) in one hand, and hold and described to the society; but allow me to add a it under the infested flower, and with the other calculation of its astonishing increase. There are hand disturb the bugs, and they will instantly three complete broods in every year, and each fly fall into the water, and cannot extricate them-deposites from one to two hundred eggs: take the selves, and in that way I have collected great smaller number and say that one fly deposites 100 quantities of them, which by throwing into hot eggs, which call the first brood; these 100 each water were in a moment destroyed; and I am

ture, and doomed "to eat bread in the sweat of his

ace," and to be annoyed during his pilgrimage here below. I fully believe such to be our situation; nevertheless, I have the most perfect reliance that when man faithfully exercises the powers with which he is endowed, he is restored to his pristine state, and that he has as complete "dominion over the fish of the sea, and over the fowls of the air, and over every living thing that moveth upon the earth," now, as he ever had; that he is still Lord of this world. All the evils that are upon us are of our own doings, and the moment we turn from the error of our own ways we shall be blessed with the proper remedy. But we are not to be mere idle spectators, we must devise all possible means of working; we must be up and doing, and there is a part for each one of us to perform-every member of the society can and ought to do something; those who do not like to write, let them speak, or take their own way of communicating their knowledge; and in that way I am sure they will be useful. In the South part of the county at Wednesbury, And remember that "your own knowledge is as Dudley and Sedgley, not far from Wolverhampnothing unless others know you to possess that knowledge; besides if you possess knowledge that others need, (and I have no doubt but every one of you do,) is it not your bounden duty to offer Under-Line, and is better for the forge than the a supply? And so far from detracting from kitchen. The C-nal Coal, which give a very clear your own store, the very act of imparting would and bright flame, derives its name from Canwil, tend to your improvement. Thus it is, my an ancient British word for candle." friends, that I have so freely, on all occasions, It is said, also, that under the s tender my little stock; and although not of much value, yet it has afforded myself both pleasure and profit.

COLLECTANEA.

He reaped the field, and they but only gleaned. Dryden.

CATS.

These animals have met with very different receptions among various nations. By the Egyptians they were worshipped as deities, and, at, death, were embalmed and interred in catacombs. If the statement of Herodotus is correct, when the house of an Egyptian took fire, he first hastened to convey his cats to a place of security, and afterwards looked about for his wife and children. In some cities of Europe, on the contrary, it was the custom, on St. John's day, to burn a cat, with all the honors of an auto da fe. Buffon was of opinion, that the cat was "a selfish and faithless servant, that conformed to some of the habits of society, without being imbued with its spirit, and whose predatory and robberlike disposition had not been totally eradicated, but only modified, by a careful education, into the flattering stupidity of a knave." Rosseau preferred the cat to the dog, because the one has preserved its freedom and independence, while the other has willingly entered into bondage.— Petrarch entertained the most lively affection for a cat, the companion of his solitude. Mahomet preferred cutting off the sleeve of his robe to disturbing the repose of his favorite Grimalkin, that had fallen asleep upon it. Madame Helvetius had a cat who, after a long attachment, in which puss showed some traits uncommon in the feline race, fled to the cemetery of its mistress, and expired upon her grave. Poets have sung their praises, and Artists devoted their talents to them; amongst the latter, Godfrey Mind, of Switzerland, is distinguished; he painted them in every situation and attitude, and with such astonishing skill and fidelity as to have been called the Raphael of Cats.

evinced an unaccountable antipathy, and there The ears, which are small, grow near the are some to whom the sight of a cat would occasion the greatest terror, sometimes producing convulsions.

From the same. COAL.

Looking into an old book, entitled "A new Display of the Beauties of England," which, besides a description of the public edifices, royal palaces, noblemen's and gentlemen's seats, &c. &c. &c. contains a body of information as to the topography, geology, &c. of the different counties, I find the following remarks as to the coal of Staffordshire:

"Besides plenty of turf and peat, for firing, this county yields three sorts of coal, which are distinguished by the names of Pit Coal, Peacock Coal and Canal Coal. The Pit Coal is dug chiefly decting various colors, like those of a Peacock's tail, is found at Henley Green, near New Castle

It is said, also, that under the surface of the ground are found yellow and red ochre, pipeclay, potters' clay, fullers' earth, blue brick earth, (the same of which the Romans made their urns) firestone, lime-stone, iron ore, (of superior quality,) copper ore, lead ore, blood-stone, alabaster, marble. &c.

As the conformation of the earth is found to be nearly the same in different countries, so that when we meet with one characteristic we may reasonably expect to find the same concomitants which usually attend it elsewhere, may we not expect to find, near our beds of Peacock Coal: on the head waters of the Schuvlkill and Lehigh, the other kinds of Coal, Earths, Minerals, &c. which are in Staffordshire?

If the argument from analogy will hold, it Coal trade, or are proprietors of lands in those Districts, to dig deep and explore wide—perchance they may find other species of Coal, and Earths and Minerals, which will increase their own wealth and add to the prosperity of our state and city. As yet, their researches seem to be satisfied with one discovery, eminently important indeed, but they have been limited to a few spots, and merely to the surface.

TO THE EDITOR OF THE AMERICAN FARMER.

Philadelphia, Feb. 26, 1823. MAPLE SUGAR, AND EARLY CORN. DEAR SIR,

I have directed some Susquehanna County Maple Sugar, and Indian Corn, to be sent to Mr.

Of the sugar, upwards of an hundred tons have been made in a season, in Susquehanna county. Where care is taken in the making of ground, on which I have set two thousand pailsto the superb tree which produces it; but de-tude. The labour required to manage my facto-

ground. A person accustomed to your southern corn, on looking slightly at a field of this, would think it of little value; but on examining it close-, and counting the number of ears in a short space, would have reason to alter his opinion.— However, I am not certain that it will answer well in your climate; your seasons may be too warm and dry for it. It requires a good and deep soil. I have raised at the rate of one hundred and thirty six bushels of it on the acre in Susquehanna county-but with some persons in the vicinity of this city, to whom I gave it, and who raised it last season, it did not turn out well. I am, Sir,

Your very obedient servant, R. H. ROSE. otl

FROM THE HERKIMER PEOPLE'S FRIEND.

MAPLE SUGAR.

Fairfield, May 29, 1822.

DEAR SIR,

An improvement in the manufacturing of sugar from the maple, is loudly called for, from the negligent manner in which the business is generally managed. For many years have I been exerting myself to effect such an improvement, and by an experience of seven years in my present method of operation, during which time I have been able to improve the quality of my sugar every year, my sample will now compare, according to the opinion of the most respectable udges, with any that is made from the juice of the cane.

According to the notice inserted in the 'Plough Boy last year, I manufactured in the season of 1821, six thousand pounds of sugar from the sap of the maple. The present season I have made at the same factory, about six thousand and ninety pounds, of the best quality of sugar-as will appear to those who have never seen it, when informed, that last year and the present, my sugar sold, and is selling from ten to twelve dollars ought to encourage those who are engaging in the respectable families, to the most Muscovado.-Many samples have been sent abroad both to New-England and New York.

Presuming that the result of my experience on this important subject, would be pleasing to you, and I doubt not useful to the public, I thought proper to add a few hints respecting my sugar factory. The subject is important, because it is undoubtedly true, that the sap of the maple is the purest sweet known, if unadulterated by the hand of the manufacturer. About three fourths of my sugar is stirred off dry and packed into dry casks, and thus keeps in perfect order, without being subject to any drain of molasses; the remaining 1-4, is drained with clay in the heat of summer, and is then nearly equal to lump sugar, This circumstance shows that sap is less adulterated than the juice of the cane, for all the West Bailey of this place, for you. I am informed that India sugars are subject to drain of molasses of they will go by the stage.

I am informed that India sugars are subject to drain of molasses of from 1-3 to 1-4 (See Edwards' "West Indies.")

My sugar lot is in the town of Norway, (Herkimer county) and encloses about fifty acres of it, I think the maple sugar, much superior to to the largest trees 4 pails, to some 3, to others that which is made from the cane. It would be a 2, and to many 1; my whole number of trees in profitable article of domestic produce, were it use about eleven hundred, making an average properly attended to. But I regret to see my crop from a pail of 3 lbs. and from a tree 54, neighbours in clearing their land, pay no respect which is considered a fair estimate for this latistroy it with the rest of the timber.

The corn is a very early kind—it should be without a knowledge of the plan might exceed to the planted in rows, about three feet apart—the belief. I have but one place for evaporating, plants a foot from each other in the rows. It is where all the sap is collected; and all necessary about not experience in the rows. ble for their leve of this animal, others have short, not growing higher than five or six feet. house room prepared to store pails and reservoirs

ed to it in one minute without moving the cask; so abound with maple sngar. and in a similar way the sap is conducted into the evaporators, as need requires.

G. H. Feeter, Esq. Little Falls.

ON GRASSES.

To the Recording Secretary.

DEAR SIR-At your suggestion, that there product was as follows, viz though an extra sled has been kept in case of ne-might be some utility in publishing the result of some experiments made the past season upon of sheet iron, weighing 3 lbs. to the square foot, the evaporation of certain Grasses, &c. in the each of which is about 9 feet in length, 6 feet process of drying or making for safe and useful wide, and 12 inches deep. The plan of setting preservation; I herein inclose the same to you

The great object of research seems to be, evaporators or pan; a flue is made in the cen-what is that admirable process of nature, (as yet tre, so that no fire is permitted to strike the sides too little understood,) by which vegetable life is of the pan, but its whole force comes upon the sustained and promoted? And how can this be bottom only. Last season three of these pans traced or pursued so as to allow the human skill from ripeness, and many other causes, such as were used, and the present only two were in use, and ingenuity the nearest approach to the wonto evaporate the 6090 lbs. in consequence of the derful perfection of the great design? That this moderate flowing of the sap.

According to the calculation which I have made, sugar makers may venture to set seven or eight hundred pails to one of these pans, provided dry wood be procured, and the fires kept up defer the calculation which I have accomplished, and that we are in full progression to this effect, cannot be doubted. The disciplination of these pans, provided dry wood be procured, and the fires kept up to the theory of agriculture, have of late shed through the night, in case of extraordinary runs, to the theory of agriculture, have of late shed which, however do not often happen. I have such a light upon the subject, and these have used from four to five cords of wood to a thousand been so followed up by practice and confirmed pounds of sugar made, which is cut and put un-by experience, that the result is indeed most I find an enquiry, as to the kind of manure best der cover, a year before used.—The above plan auspicious, and marks the present age as an era adapted to the raising of sweet potatoes, and the

sugar, as it is acknowledged by all who have be- mysterious, and can only be unfolded to the most

were cut in all directions, nearly parallel to each one of the stands more than and so near that no tree stands more than and unimpaired.

Much more should be written to give you a full element, it is beneficial." To prove that water means the labour of carrying the sap by hand is knowledge of my whole process of operation, and enters largely into the composition of vegetables, only the same as if the number of trees stood on after all the theory, nothing but experience can and is thus advantageous, the same writer ob-

The loss of weight by drying will be found in diameter, and containing about a hogshead .- cede in a great measure the importation of West this country to vary very essentially from what When drawn to the reservoir, the sap is conduct- India sugars into these northern regions, which takes place in Scotland, especially as it respects different plants. But our hay is of necessity made lighter by the heat of our summer, as well as for the purpose of its being stowed in large bodies and tight barns.

It should be premised, that the time of cutting the several grasses, &c. in the following statement was the same as is usually practised by husbandmen in our state.

Of 100 lbs. of vegetables cured in 1822, the

:	product was as follows, viz.		
	lbs.	1	bs.
	100 " of Green white clover, gave of hay	174	44
	100 " of Red do. gave	273	66
	100 " of Herds' Grass, gave	40	44
	100 " of Fresh Meadow, gave	38	66
	100 " of Salt Grass, gave	03	66
ı	100 " of Mixed, 2d crop on Eng. Rowan,	183	66
	100 " of Corn Stalks, gave	25	44
	100 " of do. out in milk with the ear,	25	44

It is to be observed, that the weight will vary wetness of season, shade, thickness of growth, &c.

I am, Sir, with respect, yours, JOHN WELLES.

Dorchester, Oct. 1822.

CULTURE OF SWEET POTATOES.

Hopkinsville, Kentucky Jan. 30th, 1823.

J. S. SKINNER, Esq.

Sir-In the American Farmer, of the 3d inst. adapted to the raising of sweet potatoes, and the of evaporating is well worthy of consideration by of improvement.

those who wish to improve the quality of their But the process of nature is indeed subtle and readily agree with the enquirer, that this is a most valuable vegetable, and has been too long very much neglected. Yet I make no pretensions to answer his enquiries on this subject; but It carries on the evaporation without the least compose vegetable life, and different degrees in only to state a few facts, giving a brief detail of

all its purity without the scorching or burning, in relation to vegetation has been to shew the only by the eye, when viewed in bulk, and a lar-

will evaporate 200 gallons, and sometimes more peared, that an acre of ground gave according with perfect safety, while the tender may be entited to the atmosphere in a day by evaporation only. When sap is boiled in cast iron of this element is thus of the atmosphere in a day by evaporation only. kettles, it is impossible to preserve the purity of The operation of this element has appeared so prepared, throw it into ridges, three and a half the sweetness in its natural state—but it will be extensive that it has led to the most delicate extensive that the most delicate extensive the most delicate extensive the most delicate extensive the most delicate extensive the most delicate e the sweetness in its natural state—but it will be come adulterated and darkened, in proportion to the heat applied above the surface of the sap.—
To this circumstance alone is to be attributed the most deficate experiments, and induced some even to suppose it the surface of the sap.—
To this circumstance alone is to be attributed the mapleasant fact of maple sugar being so universally bad, especially in the color. It was first calculated that sugar making on so large a scale with a calculated that sugar making on so large a scale with and weight in a few years;—whilst on a lands; but incredible as it may appear, five hands; but incredible as it may appear, five hands; but incredible as it may appear, five hands managed my work last year with case:

To this circumstance alone is to be attributed the curious instance has been frequently published. A curious instance has been frequently published on a leaden vessel with a given quantity of earth, and supplied constantly with the two preceding, then cover them with a hoe, pulling up the earth from between the ridges. It is desirable to cover them with rich hands; but incredible as it may appear, five hands managed my work last year with case:

To this circumstance alone is to be attributed the curious instance has been frequently published. On top of these ridges lay your plantings one foot apart, each planting forming a triangle with two or three inches of each other. On top of these ridges lay your plantings one foot apart, each planting forming a triangle with two or three inches of each other. On top of these ridges lay your plantings one foot apart, each planting forming a triangle with two or three inches of each other. On top of these ridges lay your plantings one foot apart, each planting forming a triangle with the two preceding, then cover them with a better the willow thrived and acquired great has a layer of the solor. To this circumstance in the upper points of the two or three inches of each other. On top of these ridges lay your plantings one foot ap hands managed my work last year with case; in osensible diminution had taken place.

It is observed by an ingenious writer,* to whom which the sap has overflowed, four hands only have been employed. The total expense of fit-ling up the above works was about \$750.

The evaporators are not removed during sumfound, upon trial, to take far less labour than the usual method of making and planting in hills .-

* Sir John Sinclair.

The chief of the tillage, until you come to hil-understand that Mr Wm. Fink,* a name always Homespun, not less than ten yards, of a Cotton ling, may be done with a light one horse plough. delightful to the ears of the lovers of roast beef, Warp and Wool Filling. But the greatest saving of labour is in gathering ridge on the vines. Nearly all the potatoes will ately to your potato cellar, which ought to be uncovered every day until they are done sweating.

The chief advantage, however, which I promise myself is the subsequent use I make of my potato lot. Those who prefer the old mode of management, may still pursue it, and derive the same advantage in giving their ground an apti-tude for the growth of this root. Nothing is necessary to insure an annual increase of crop, the seasons being equal, than as soon as you get your potatoes off the ground to turn in your hogs intended for slaughter, and there to fatten them, until good crop made where this plan had been purneighbour, without it, made any.

If you deem the foregoing worthy of being presented to your correspondents, you are at liberty to do so.

Your's &c.

A. Z.

doubt, the chief benefit is by the deep rooting contest, would amply compensate for the expense of the hogs, and consequent action of frost upon and trouble of raising and bringing on the animal

FOR THE AMERICAN FARMER. PRACTICAL QUESTIONS.

Mr. Skinner,

I have a choice lot of 15 acres in fine heart, but foul with blue grass and rib-wort-it was well ploughed last fall; my wish is, to put it down in September to wheat. I should be greatly obliged to any of your *practical* correspondents for advice, which doubtless might benefit many others, as well as myself, as to the most advantageous and economical crop, that may in the interim be taken from the lot in question, and which crop would also, at the same time, be a good preparative for the wheat crop, and not in of Twenty dollars, or a Silver Cup of that value, any material degree lessen the strength of the at their stated meeting, the 3d Monday in Januground? If there be no such advisable crop, 1 ary, 1824. should be glad to learn what they deem the best and cheapest method of putting the ground in a clean tilth for wheat?

I wish also to be informed, whether Millet be thought a great exhauster when cut for hay-and if it may not be sown with safety and advantage, early in the spring?

A YOUNG FARMER.

Anne Arundel, February, 1823.

FAT CATTLE.

One of the finest lots of fat cattle has recently arrived in this city, perhaps, that has ever been dinary steers, fattened by Mr. Monmouth Purdy, of Scipio, Cayuga County. We have been warnthey passed. These cattle have been purchased land; 2d, For the best Hog, not more than two what vaguely applied. The fact no one will dispute, of Fulton Market, and the beef will be not more than one year old; and 4th, For the mous as to the explanation of which the circum-offered for sale on Saturday the 8th of March. It best Ram. ed of the approach of these animals in anticipas supposed they will weigh from 2500 lbs. to 3000 lbs. each; one pair for which the purchasers gave \$500, is judged to weigh 6000 lbs. We ten yards; and 2d, For the best specimen of pox which so frequently follows vacciuation, and

says that he has never before seen 12 steers equal your crop; which is performed after throwing to these; and Mr. Pardy certainly deserves enthe vines in a line between the ridges, then with a plough, throwing one third on each side of each character of western beef. When he first went Potato, Two dollars. The Pumpkin and Potato, into the western part of this state, the cattle raised to must be exhibited to the Society on that day, be left in the remainder of the ridge, which are in that region, were considered rather inferior; to be thrown in baskets, and conveyed immedi- but such has been his success in improving the breed, and in fattening and driving them, that the Should the Animals exhibited not be deemed butchers are now anxious to obtain supplies from above mediocrity, the Society will not award a thence. The cattle were driven 6 miles per day; and the inhabitants of two of the villages on the way, paid Mr. P.\$30 respectively, as an encouragement for preseverance in producing such extraordinary fine animals for the market .- Com. Adv.

* Already aware of the enterprise of this gentleman in the line of his business, and others in the State of New York-we are somewhat surprised that the offer of one of the most wealthy they are ready for slaughter. I have known a and respectable Farmers in Virginia has not been taken up-we allude to the offer to risk sued in a very dry season, when not a single the sum of \$500 that he would produce at the Maryland Cattle Show, in 1824, a bullock yielding a greater nett weight than any that could be produced at the same place, bred in the state of New York. We have no doubt that \$500 would be given by Mr. Rusk, or some of our spirited victuallers here, for the prize beef, and surely Note. You will perceive that I have not at- the sum of \$1000 for a single bullock, togethtempted any reasoning on the foregoing; no er with the honour of victory in an useful the earth-moreover, some manure is deposited, to Baltimore-the transportation of such an one from New York to this place, might be effected without a mile of land carriage. The Editors of the New York Statesman are requested to copy the original challenge from the American Farmer, that the spirited graziers and victuallers of that town and state may not plead ignorance of the opportunity now presented of plucking if they can, another feather from the Agricultural cap of the "ancient dominion."—Edit. Am. Farmer.

AGRICULTURAL PREMIUMS.

The Farmers' Society of Barnwell District will award the following premiums-each to consist

1st, For the best Male or Female Calf, not more than one year old; 2d. For the best Bull, Steer or Heifer, not more than two years old; 3d, For the best Stallion, or brood Mare.

Also premiums of Fifteen dollars or a Silver Cup of that value-1st. For the greatest quantity of Indian Corn, the produce of one acre of upland; 2d, For the greatest quantity of Indian Corn, the produce of one acre of either swamp or pond land. The Corn may be of Carolina Seed, or obtained from any part of the United States; 3d, For the greatest quantity of Rice, the produce of one acre of either high or low, land, and 4th, For the greatest quantity of Root or Slip Potatoes, offered in our market, It consists of 12 extraor- the produce of one acre of either high or low

Also, Premiums of Ten dollars or a Cup of that value-1st, For the greatest quantity of Peas,

At the stated Meeting on the 3d Monday in

Each Animal must be raised by the competitor, and exhibited at the said meeting in January.

The Acre to be square and not more than 210 feet square. The Crops must be planted and harvested in a sound and merchantable state, within the period of twelve months. A detailed account of the mode of cultivation and preparation is requested.

It is expected all candidates will produce such testimony as to prevent any doubts relative to the correctness of their statements in regard to the age of their animals, and the produce of their fields

JOHN S. BELLINGER, President. SERMON BONSALL, Sec'ry. pro. tem. Barnwell Court House, Jan. 23, 1823.

IMPORTANT MELIORATION IN SUR GERY.

The formidable operation of Lithotomy, or of the extraction of the stone or calculus, is now reduced to a degree of simplicity almost incredi-ble, by an invention of W. W. Sleigh, Esq. Pro-fessor of Anatomy, Physiology and Surgery in this city. We shall not mention the particulars, except the remarkable circumstances that follow. The skin is not touched with the knife; the operation occupies not more than the eighth part of a minute; and it is not accompanied with much more danger or pain, if it is so much, as the bleeding in the arm. Thus an operation regarded by the most celebrated men of the age as accompanied with the most imminent danger, and the most acute pain, becomes as simple as mere venesection. We understand that the operation, such as it was originally conceived by Dr. Sleigh, was subject to many difficulties, which have been effectually obviated by certain measures discovered by him during the last twelve months of his application to the subject, without which it cannot be undertaken with safety. The Doctor has not yet communicated his method in full to any one; but he will soon publish a treatise in London, where we understand he intends going in the course of the approaching summer. We have seen a stone which the Doctor ex-

tracted on the 18th inst. It weighs, independently of numerous fragments, 788 grains; and its circumference, measured in two opposite directions, is five inches. The patient was well on

the third day .- Montreal paper.

-00 VACCINE INOCULATION.

It is a very remarkable circumstance, that since vaccine inoculation has become general, as a substitute for small-pox, we scarcely ever see or hear of those eruptive disorders to which the stance is susceptible. Dr. Thompson maintains, and we think justly, that all varioloid diseases

THE AMERICAN GARDENER.

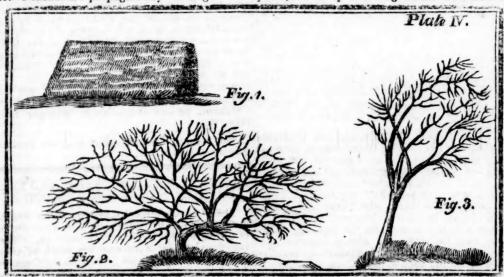

CHAPTER V.

FRUITS. Propagation, Planting, Cultivation.

LIST OF FRUITS.

318. PEACH.—The peach being the principal tree for the garden, I shall under this head,

stock should be of plum, for the reasons given | Montaubon, 1 Vanguard, 6 Royal George, in Paragraph 281 .- The tree is to be planted, Grosse Mignonne, 4 Early Noblesse, 3 Gallande, agreeably to the directions in Paragraphs 282 to 2 Bellgarde, 2 Late Noblesse. These are all 288. And how for the pruning and forming the to be had of Mr. Prince, of Flushing, in this tree. Look at PLATE IV. fig 2, and fig 3. island, and, as to his word, every body knows. The first is a peach tree such as I would have it that it may be safely relied on. What is the at four or five years old; the last is a peach tree trifling expence of 30 trees! And when you once such as we generally see at that age. The practice is to plant the tree, and to let it grow in its life. Even for the feeding of hogs, a gallon of give directions for pruning and forming the own way. The consequence is, that, in a few peaches of either of the bove sorts is worth tree.—Peaches are propagated by budding. The years, it runs up to a long naked stem with two twenty gallons of the poor pale, tastless things

or three long naked limbs, having some little weak boughs at the tops, and, the tree being topheavy, is, nineteen times out of twenty, leaning on one side; and, it presents, altogether, a figure by no means handsome in itself or creditable to the owner.—This is fig 3.—Now, to have fig 2, the following is the way.—The tree should, in the first place, be budded very near to the ground. After it be planted, cut it down to within a foot and a half of the ground, and always cut sloping close to a bud. In this foot and a half, there will be many buds, and they will, the first summer, send out many shoots. Now, when shoots begin to appear, rub them all off but three, leave the top one and one on each side, at suitable distance lower down. These will in time become limbs. The next year, top the *ufright* shoot (that came out of the top bud) again so as to bring out other *horisontal limbs*, pointing in a different direction from those that come out the last year. Thus the tree will get a spread. After this, you must keep down the aspiring shoots; and, every winter cut out some of the weak wood, that the tree may not be overburened with wood. If, in time, the tree be getting thin of bearing wood towards the truuk, cut some of the limbs back, and they will then send out many shoots, and fill up the naked places. The lowest limb of the tree, should come out of the trunk at not more than 9 or 10 inches from the ground. The greater part of the tree will be within the reach of a man from the ground; and a short step-ladder reaches the rest .- By this management the tree is always in a state of full bearing. Always young. To talk of a tree's being worn out is nonsense. But, without pruning it will soon wear out. It is the pruning that makes it always young. In the "Ecloe du ardin Potager," by Monsieur DE COMBLES, there is an account of peach trees in full bearing

twelve feet in breadth, or heighth, and in full bear-ing in every part. Here is a space of six hun-is very little inferior to the very finest peach; derd square feet, and, in case of a good crop, and I never tasted a better Green-gage than I four peaches at least in every square foot, mak- have at New York. It must therefore, be neging, in the whole, 2,400 peaches, which would ligence. But Plums are prodigious bearers, too; fill little short of ten or twelve bushels. This is to be seen any year at MONTREUIL in France. This tree is grafted upon plum-stocks, To be sure, these trees are tied to trelises and raised from stones by all means; for suckers send have wells at their backs, the stones are tied to trelises and raised from stones by all means; for suckers send have walls at their back; but this climate re- out a forest of suckers .- The pruning is precisely fruit and large crops may be had in a country have in the garden should be 4 Green-gages, 1 where blights are almost unknown, and where Orlean, 1 Blue Perdrigon.
the young fruit is never cut off by frosts, as it is in England and France. To preserve the young and in very rich ground. It is raised from cutfruit in those countries, people are compelled to tings or layers, and these are treated like other cover the trees by some means or other, in March cuttings and layers.—Quinces are dried like and April. Here there needs no such thing. apples.

When you see the blossom, you know that the fruit is to follow. By looking at the Plan of the but produces fruit that vies, in point of crop as makes it always young. In the "Ecloe du ardin Potager," by Monsieur DE Combles, there is more difference than there is an account of peach trees in full bearing at fifty years old. And, little do people here imagine to what a distance a peach tree will, if properly managed, extend. Mr. de Combles speaks of numerous peach trees extending to more than fifty feet in length on the trelis, and

twenty gallons of the poor pale, tastless things that we see brought to market.--As to dried peaches, every body knows that they are managed as dried apples are; only that they must be

gathered for this purpose before they be soft.
319. PEAR.—Pears are grafted on *pear-stocks*, on quince-stocks, or on those of the white-thorn. The last is best because most durable, and, for dwarf trees, much the best, because they do not throw up wood so big and so lofty. For orchards, pear-stocks are best; but not from suckers on any account. They are sure to fill the orchard with suckers.— The pruning for your pear trees in the garden should be that of the peach. The pears will grow higher; but they may be made to spread at bottom, and that will keep them from towering too much. They should stand to-gether, in one of the *Plats*, 10 or 11.—The sorts of pears are numerous; the six that I should choose are, the Vergalouse, the Winter Berga-mot, the D'Auche, the Beurre, the Chaumontelle, the Winter Bonchretian.

320. PLUMS.—How is it that we see so few plums in America, when the markets are supplied with cart-loads in such a chilly, shady, and quires neither; and, surely, fine trees and fine that of the peach.-The six trees that I would

Garden, PLATE I, you will see, that the *Plats* No. well as flavour, with that of the proudest tree. 8 and 9, contain 30 trees and the two vine trelises. I have never seen them fine in America since I The Plats are, you will remember, 70 feet long saw them covering hundreds of thousands of and 56 wide. Of course, putting 5 trees one way are so of ground in the Province of New Brunsand 4 the other, each tree has a space of 14 feet, wick. They come there even in the interstices so that the branches may extend horisontally 7 of the rocks, and, when the August sun has parchfeet from the trunk of the tree, before they meet. In these two Plats 14 feet wide is left clear for fruit. Where woods have been burnt down, the grape-vines.—These 30 Peach-trees, proper-ly managed, would yield more fruit, even in bulk, than a large orchard in the common way; and autumnal food for flocks of pigeons that darken ten times as much in point of value; the size as the earth beneath their flight. Whence these well as the flavour of the fruit are greatly improved by this mode of culture.—However, the sort is of very great consequence. It is curious enough, that people in general think little of the contenting myself with relating how they come contenting myself with relating how they come sort in the case of peaches, though they are so and how they are treated in gardens.—They are choice in the case of apples. A peach is a peach raised from suckers, though they may be raised it seems, though I know of no apples between from cuttings. The suckers of this year, are

ongest. These should be cut off in the or early in the spring, to within four feet of the ground, and should be tied to a small stake. A straight branch of Locust is best, and then the stake lasts a life-time at least, let the life be as long as it may. The next year more suckers come up, which are treated in the same way .the other. To have them fine, you must dig in and this part of the book can, at any rate, do beautifully blowing Laurel tribe; the Rose of manure in the Autumn, and keep the ground him no harm.

Charon (as it is called here) and the Althea Frumanure in the Autumn, and keep the ground him no harm. clean during summer by hoeing .- I have tried to dry the fruit; but it lost its flavour. Rusberry ing trees and shrubs; and, therefore, I must, in kinds. But, there is one shrub of the larger kind, Jam is a deep red sugar; and rasberry-wine is this place, say a little of these and of ornamental abundant here, that I never saw there, and that red brandy, rum, or whiskey; neither having the gardening. It is by no means my intention to is the thing which some call the Morning Star. taste of the fruit. To eat cherries, preserved in attempt to give an account of all the flowers that It has six leaves in its flower, which is in the form spirits, is only an apology, and a very poor and come into the florist's catalogue. That cata-of the flower of the single rose. The whole flowerence, man ought to avoid, and the very thought of giving way to which ought to make the cheek this in bulk. I do not blame the taste of those quite white, and others blossoms of a whitish of a woman redden with shame.

323. STRAWBERRY .- This plant is a native of the fields and woods here, as it is in Europe. There are many sorts, and all are improved by cultivation. The Scarlet, the Alpine, the Turkey, the Haut-bois, or high-stalked, and many others, some of which are white, and some of so deep a red as to approach towards a black. To say which sort is best is very difficult. A variety of sorts is best.—They are propagated from young plants that grow out of the old ones. In the summer the plant sends forth runners. Where these touch the ground, at a certain distance from the plant come roots, and from these roots, a plant springs up. This plant is put out in. And, in the placing of the whole trees and early in the fall. It takes root before winter; plants, the most lofty should be furthest from the and the next year it will bear a little; and send walk. out runners of its own .- To make a Strawberrybed, plant three rows a foot a part, and at 8 clean, and the new plants, coming from runners, will fill up the whole of the ground, and will ex-tend the bed on the sides.—Cut off the runners you have a bed three feet wide, covering all the ground; and this is the best way; for the fruit then lodges on the stems and leaves, and is not beaten into the dirt by heavy rains, which it is if the plants stand in clumps with clear ground rate between them.—If you have more beds than one, there should be a clear ground of the feet wide, the feet wide, the feet wide, the feet wide, the feet wide again observe, that I merely give a selection, that I merely give a selection, such as appears to me to be best calculated for gratifying, at different seasons, the sight, or gratifying and management; but, to be very particular would be superfluous, seeing that such full directions have been given in the former parts of the work, as to the sowing of all seeds, great as well there should be a clear gratify in the first of the former parts of the sound of the first of the former parts of the sound of the first of the former parts of the at six inches distance from the sides, and then there should be a clear space of two feet wide between them, and this space should be well manured and deeply digged every fall, and kept clean by hoeing in the summer. If weeds come up in the beds, they should be carefully pulled out.—In November the leaves should be cut off with a scythe, or reap-hook, and there should be a little good mouldy manure scattered over them. -They will last in this way for many years. When they begin to fail, make new beds. Supposing you to have five or six beds, you may

324. VINE .- See Grape.

325. WALNUT .- The butter-nut, the black walnut, the hickory or white walnut are all in-habitants of the American woods. The English quarters of a mile long and, perhaps, thirty fee Filberd, which see.—It is possible, that the blood.

Madeira Nut grafted upon the black walnut, or 331.

CHAPTER VI.

FLOWERS. Of Flowers, and of Ornamental Gardening in General.

of my subject, have been stated in Paragraphs 6 pha, blossoms far more beautiful than those of Fifty clumps are enough, if well managed .- There and 97. However, if the American Farmer have the horse-chesnut, broad and beautiful leaves are white and red, some like one best and some no taste for flowers, his wife and daughters may; that do not scorch in the hottest sun; all the

that stand most prominent as their capacity of earlier than the peach blossoms. In England making a beautiful show and of sending forth they would be out full, on an average of years, in

honey-suckles, and the like, may be planted by the sides of the broad walks in the kitchen garden, or a little piece of ground may be set apart unaccompanied by leaves, shining through the for the purpose. In cases where there are what are usually called *pleasure-grounds*, large shrubs, and, if the grounds be extensive, lofty trees come

329. As to the manner of sowing planting, transplanting, and cultivating, what has been inches a part in the rows. Keep the ground said of fruit trees and of garden vegetables and come. herbs applies here. The ground must be good, flowers will not be fine.

330. Before I proceed to the Alphabetical List the Kalmia and hundreds of other shrubs, which from cuttings, slips, layers, and suckers, and as make one new one every year; and thus keep plants in this world, chosen as the most conspicu-your supply always ample. plants in this world, chosen as the most conspicu-ous ornament of the King of England's will give a grand bloom from May to November. grandest palace, that of Hampton-Court, where, growing in a rich soil to the height of five or six feet, it, under the name of "Golden Rod," nods and French Walnut, called here the Madeira wide, the most magnificent, perhaps, in Europe. Nut, is too sensible of the frost to thrive much But, be not too hasty, American, in laughing at in this climate. Two that I sent to Pennsylvania John Bull's king; for I see, as a choice flower in in 1800 are alive, and throw out shoots every year; your gardens, that still more pernicious Europe-but they have got to no size, their shoots being an weed which the French call the Coquelicot, generally cut down in winter.-Walnuts are and the English, the Corn-Poppy, which stifles raised from seed.—To preserve this seed, which the barley, the wheat, and especially the peas, is also the fruit, you must treat it like that of the and frequently makes the fields the colour of

have been got from America. The Wild Cherry, which they call the bird-cherry, which here grows sometimes to the height of a hundred feet, and one of which I can now see from my window more than seventy feet high; the Locust, most 326. My reasons for making Flowers a part beautiful of trees and best of timber; the Catal-327. Under the head of Flowers come flower- lex; the Azaha of all colours; Roses of several who study botany, and who find pleasure in the peach blossom colour. These blossoms come the possession of curious trees and plants; but all earliest in the spring. They are out full, in Long that I shall attempt, is, to speak of those flowers Island, in the first week in May, which is rather the last week of February, which is an anticipa-328. As to the spot for flowers, the smaller kinds and even small shrubs, such as roses, dwarf great quality, thrive well under other trees, which indeed, seems to be their nature. You see, from a great distance, their bright and large blossoms, boughs of the other trees; and some of them reach the height of forty feet. This, therefore, is a very fine flowering tree; and yet I never saw one of the kind in England. How beautiful a grove might be made of this tree, the wild-cherry, the Locust, the Catalpha, and the Althea-frutex! And here they are all, only for the trouble of sowing; for from the seed the tree will surely

332. I shall now proceed to give an Alphabetiwell tilled, and kept clean, or the plants and cal List of such flowering Trees, Shrubs and Plants as I think worthy of cultivation; or, rather, that I myself would wish to have about my think nothing of the Arbutus, the Rhododendron, as small; as to the raising of trees and plants are amongst the choisest in England. The little cultivation and tillage. Flowers are divided into dwarf brush stuff, that infects the plains in Long annuals, biennials and perennials. The first blow Island under the name of "Kill-Calf," is, under a and die the year they are sown; the second fine Latin name, a choice green house plant in blow the second year and then die; the third some-England, selling for a dollar when not bigger times blow the first year, and sometimes not, and than a handful of thyme. Nay, that accursed die down to the ground annually, but spring up stinking thing, with a yellow flower, called the again every spring. I have not made separate "Plain-Weed," which is the torment of the lists; but have included the whole in one Alphaneighbouring farmer, has been, above all the betical List. There are sixty trees, shrubs and

LIST.

333. ALTHEA FRUTEX.-It is raised from seed, or from suckers. There are several sorts, as to the colours. They should be mixed to make a variety. Save the seed in November or December. The pods are full. Sow in the spring. Seed produces the handsomest shrub;

and it is to be got almost any where.

334. ANEMONE.—This is a very beautiful flower, and worthy of great pains. It is raised from seed, or from pieces of the roots. Sow the seed in spring. The plant does not blow the first year. The root, which is tuberous, is taken up 331. This is quite sufficient to show the power in the fall, dried in the sun, and put by in the ground apon either of the other two might thrive in this of rarity in affixing value on shrubs and flowers, till spring, when it is put into the ground again. The finest flowering trees and shrubs in England And, during the summer, it sends out young roots,

well known as the oak tree; and is to be got every where.

hotted, and kept to blow in the green-house. If and to keep them in a green-house in winter, It is perennial.

planted in the natural ground, they ought to be or in some house where they can have sun and covered a little in the winter. There are many hundreds of sorts with names. So many indeed, be bestowed upon them.

as of flower, but give us no fragrance; others, like after that they have been compelled to resort to the heroes and heroines of Romance; accordingly they have Don Quickset and Sancho. However, vanity supplies the florists, as well a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, owners, but give us no fragrance; others, like the rose, gives us this added to beauty of flower and of leaf, but, it give us them only for a part of the year. But, the Geranium has beautiful leaf, beautiful flower, fragrant smell from leaf as well owners, owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, with a great store of names, and auricular owners, owners, but give us the rose, gives us this added to beauty of flower and of leaf, but, it give us them only for a part of the year. But, the Granium has beautiful leaf, beautiful flower, fragrant smell from leaf as well and the properties of the part of the p las, like ships, are frequently honoured with away the hard part of the shoot, strip off three abundance; and as to variety of sorts, as well in the names of the original proprietor's wife or or four of the bottom leaves. Tip the rest of the leaf as in flower, it surpasses even the flower of the names of the original proprietor's wife or four of the bottom leaves. The the rest of the leaf as in flower, it surpasses even the flower of daughter.

S38. AZALIA.—That little American Hoselos our steps when shooting on the skirts of woods. It, however, blows profusely, though it has no smell like the English have roots in the fall; and you may transpectation and through those Myrtle boughs the plant them in the copen ground or into nots to deadly winged adders rustles, while all around is plant them in the open ground or into pots to deadly winged adders rustle; while all around is 339. BALSAM is an annual and most beautiblow the next year. The old Clove plant will, dry and burning sand. The Geranium is a naful plant, with great abundance of flowers. Sow however, blow for many years. I should think, tive of the South of Africa; and, though it will when you sow Melons, at a distance of four feet; that, with good covering, such as directed for not receive its death-blow from even a sharpish leave only one plant in a place; let the ground be spinach, Cloves would live out the winter in this frost, it will not endure the winter, even in the rich and kept clean; it will blow early in July, country.
and will keep growing and blowing till the frost 345. COLUMBINE.—A perennial.

mild climate of England. But, then, it is so easy of cultivation, it grows so fast, blows so soon, and comes, and then, like the cucumber, it is instant-ly cut down. I have seen Balsams in Pennsylva-ma 3 feet high, with side-branches 2 feet long, flowers, without which English pastoral poetry Geraniums if we have the means of obtaining and with a stem much bigger than my wrist, would be destitute of that which awakens the earth and sun.—The Geranium is propagated loaded with beautiful blossoms. Plant, branch, most delightful ideas. The Cowslip, the Prim- from seed, or from cuttings. The seed, like leaf. flower; all are most elegantly formed, and rose, the Violet, and the Daisy, are of endless that of the Auricula, does not produce flower or the colours of the flower extraordinarily vivid recurrence in that species of writing. They all leaf like the mother plant, except by chance. It and various. There are, however, some more come early in the spring; and are all beautiful. is easily saved, and for curiosity's sake, may be double than others, and some variegated. The Neither of them is seen here, and they all might; sown to see if a new variety will come. But, a seed of these should be sowed, and it comes in for they will bear any severity of weather. The cutting, from any part of the plant, old wood great abundance. The flower of the Balsam has Cowslip is of the Polyanthus tribe. It is of a or young wood, stuck into the ground, or into a delicate yellow colour, and sends forth many blos- pot, will grow and become a plant, and will blow 340. BRIAR (Sweet).—A well known shrub soms from the same stem, which rises about six in a month from the time you put it into the fthe rose kind. Rows of it carefully planted and inches from the ground. It may easily be proground. You must have plants, indeed, to cut ru ed make very good hedges, and it will grow in almost any ground, though fastest in good dance, but, when you once have a plant, the ground.

341. CAMILLIA.—This shrub, which is of the laurel-tribe, has lately been introduced in cond year. The plant is perennial. The flower during the summer. They will be in bloom by England from Japan. It bears a flower, which has a delicate sweet smell, and also sweet taste, July, and, before October will be large as a curwhen open, resembles a good deal a large full- as a proof of which, cart-loads of the flowers, rant tree. Take off cuttings from these during tlown rose; and these flowers, on different plants, plucked from the stalks, are sold in London to September, put them in pots, and they are ready are of different colours. It is raised, doubtless, make "wine" with; that is to say to furnish for the next spring. If you have a Green-house,

The acre being about 7900 stalks of Corn. The great obstacle well ploughed, was made into 35 beds, running to the production of great Corn Crops in our nearly east and west, and planted on the 5th March last, with genuine flint Corn, at the distance of 18 inches, on the top of the beds. On plant for a great crop, the heat of the Summers the 7th April, it was thinned to one stalk, two in most instances within my knowledge injures

instituted, and further experience can alone dein two other instances, the first of very old land, land, viz 280 bushels and 3 pecks. the second crop, was half of the first crop, and in the other of better land, the second planting was one third of the first crop. An acre of old land, old Calf. without manure, and planted in the usual way, also in Flint Corn, produced 10 bushels. During the progress of my experiment, I had reason to believe planter of our State once made a great crop of corn, from an acre of land planted in a similar way, but cannot learn his name, or the part of the State he resides in. A certificate relative to the produce of my acre of Flint Corn, from Messrs. W. J. Duncan, Wm. R. Bull, C. W. Stewart and Henry Touchstone, accompany the few obser-

vations I offer for your consideration.

I planted an acre (210 feet square) of old land with Potato slips in the following way. After it was made into flat beds, six feet wide and 210 penned on it.-No other manure was used .- or used as a pasture. From the 25th to the 28th of May, three-quarters of the acre were planted with slips, the in a state of perfection and vegetation were prevines being cut from eighteen inches to two feet long, and being doubled, were stuck in the earth eighteen inches square, and from four to five inches deep. On the 6th of June, more vines were planted, and on the 30th the acre was finished On the 17th and 18th July, the vacancies were supplied. It was hoed only twice, the vines soon covering the ground, so as to prevent the use of the hoe. On the 13th and 14th of November, they were dug and measured 280 bushels and 3 pecks-each half bushel being heaped but not packed in, and heaped in the way changed for grain.

feet square) planted with slips on four feet beds in the usual way, was dug, and measured 68 bushels—this acre (as well as the others) is of a light soil and was not measured. A certificate from Mr. H. Touchstone, relative to the Potato crop accompanies this.

JOHN S. BELLINGER. (Signed)

December 17, 1822.

1st. To James D. Erwin, for the greatest quantity of Grain, from one acre of highland, viz. 46 bushels of Corn, and 49 bushels of Peas, being 94 bushels to the acre. It is proper to state, that from some misunderstanding, relative to the time of gathering the crop from the acre, a part of the Peas were unripe, which would make a reduction of that part of the produce of his acre.

John S. Bellinger made 64 bushels and 5 quarts in the following manner—a first planting on the the evening, or perhaps not till next morning.]

5th of March, yielding 45½ bushels, and a second planting on the 21st of May, 18½ bushels and 5

ALBION'S THIRD LETTER TO HIS SON.

" Here then, my soul, thy darling theme pursue, For every day was Giles a shepherd too."

In the second letter I gave you a plan of the We give our readers to-day a very excellent Albion farm, and also a statement of the live Wm. R. Bull gathered 16 bushels of clean we have some acquaintance.—The Stove with description of our sheep, with some hints to assist you in the selection of these most valuable ample to 80 dollars, and to insure it against smoke, the mats.

These sheep were of the Bakewell kind, with ders, following it as before to the setting on of

Of all the various breeds of sheep, That butchers kill, or graziers keep, From which do we most comforts reap? The Bakewell.

What sheep, produce the richest meat, And in appearance look most neat, And pay best for the food they eat?
The Bakewell.

Which most of all, the landscape grace, Contain most bulk, in smallest space, And where they feed, adorn the place? The Bakewell.

Which best our craving wants supply, To feed, and keep us warm and dry, And make both cold and hunger fly?
The Bakewell.

Which are most tractable and tame, And will so long as sheep remain, Immortalize great Bakewell's name? The Bakewell.

These sheep produced a fleece, weighing from back, and of a quality suited for the comb-to be pets, and all kinds of goods requiring long strong wool.

This wool measured in length, from five to fifteen inches, but once I saw a small quantity twenty two inches long, and I knew a gentleman whom report said, had a fleece, which weighed twenty eight pounds, but both these I imagine were not the growth of one year: these sheep usually weighed, when two years old, from twenty to thirty five pounds the quarter, but some of them have, I think, weighed upwards of seventy

pounds the quarter.

as very superior-to judge of the quality of the teeth; shortly afterwards the teeth begin to demeat of an ox, or sheep by the touch, appears cay, when the sheep should be fattened off withto a superficial observer, as a mere fancy; but out delay, or you will always have a bad diseased AGRICULTURAL EXPERIMENTS IN THE surely this is not so difficult a task, as to judge flock. of the nature of a sick person's complaint by feeling the pulse-indeed I have no doubt, but number, those beautiful Devonshire cattle sent it is best to avoid the wool altogether, and acby Mr. Coke of Holkham, in England, to Mrs. Pattison of Baltimore.

Editorial Correspondence.

Large hogs of New Jersey-their breed-credit given to Pennsylvania for breeding fine Heifer-due to New Jersey-superior potato cultivated in that state-Hogs and Potatoes introduced by Mr. Johnston.

In No. 47 of this volume, we published a bly white and mealy, and to use the expression challenge from New Jersey to the famous rival of a gentleman, with whom I was conversing on states of Virginia and New York—that New Jertha the subject, and who has raised them for some sey would produce by the 12th of March, a years, "they are as much superior to all other heavier hog, than could be found in either of these great states, regard being had to age .-The challenge was not accepted, and as the hog that they are poor bearers, and yield so badly as has now been killed, we can give his weight, to discourage their cultivation. We grow anothhas now been killed, we can give his weight, to discourage their cultivation. with some interesting particulars, which transpired, in the course of private correspondence, led the Mercer potato, which is next in repute respecting the breed, &c. The extraordinary weight of the animal will show that the challenge much depends upon the manner of cooking then, was not offered in a spirit of vain boasting, and many potatoes are spoiled in the cooking. They also that the party from whom it came, was wil-should be cooked by steam, and as soon as done, ling to risk a sum, which would have compensathe contest; but we dare say, that those who might have felt inclined to take up the wager will now be well content, that they did not venture on the hazard.

made like these, with discernment, and calculated to promote in a matter of substantial importance, the best interests of Farmers, ought to be rewarded and signalized by permanent complimentary and commemorative premiums.

Edit. Am. Farmer.

Bridgeton, West New Jersey, } Feb. 12th, 1823.

DEAR SIR, I received your favor last evening, informing me that I had omitted the sum, I was willing to bet on the weight of the Bridgeton hog. How I came to omit that most important part of the challenge, I am at a loss to account. One hundred dollars was intended; but if any one should object on account of the sum being too small, he can be accommodated with still more, you may say \$500-a correct statement of the age however, will be demanded, as we do not expect our pig to outweigh a hog of 2, 3 or 4 years, of age. You may extend the time limited for accepting he wager to the 1st of March.

In answer to your queries, respecting the breed ported from England some years since, but I have not yet been able to trace his genealogy back far enough to say from what part of Eng- 892 lbs. land, or what he is called there—this much I know that they all grow very heavy at from 1 to root of his tail, 7 feet. 2 years of age; I shall be able to send you pigs, from a sow got by the hog, and with pig by a inches. boar owned by Mr. Johnston of this place, imported from Liverpool. Mr. Johnston's boar is a feet. very fine one, and has done great service in the neighbourhood, by improving the breed of hogs. 6 feet.

tice in the same volume, page 99, a wool spin- Mr. Johnston killed 2 weeks since, 4 pigs got by their meat, joined with the importance of taking chieves of useful knowledge, in which there has on fat well at any age. The weight of Mr. John-ston's hogs, however will not pass for a standard to judge of our Bridgeton pig by. Let me know another account, which would be the true one, which to send you, or whether you would prefer only that the two first figures are transposed. ne mixed.

> you have heard of them-they are certainly the finest potato cultivated in this country, remarkapotatoes, as the best superfine wheat flour is to common rye flour;" the only objection to them is er potato, introduced here by Mr. Johnston, calfor the table, and yields bountifully. But as removed from the fire, for if suffered to remain

Your's respectfully, EPHRAIM BUCK.

JOHN S. SKINNER, Esq.

N. B. As a satisfaction to yourself, and not for

866 lbs .- Edit. Am. Farmer.

Bridgeton, West New Jersey, ? March 5th, 1823.

MR. SKINNER,

In No. 48 of the Farmer I observe that a very important error, has been made in noticing the fine Heifer, slaughtered by Mr. Lewis Davis of this county; she is there said to have been raised and fattened in Pennsylvania-we are willing to give the "devil his due," but are by no means willing that Pennsylvania should have the credit of all our extraordinary productions, which it is very certain she has been accustomed to receive. I feel assured you will correct the statement, and place the honor where it belongs. So much for the Heifer, and now for the Pig.

The Bridgeton Pig, owned by MR. NORTON HARRIS, was slaughtered yesterday, and weigh-

ed and measured as follows:

Weight alive, 975 lbs. Weight when dressed, having all the offal, to-I can only say, that he is not, I believe of the gether with the gut fat, neatly taken out, and afgrass breed; he is descended from a stock, imter having hung up, exposed to the sun and a grass breed; he is descended from a stock, imter having hung up, exposed to the sun and a gether with the gut fat, neatly taken out, and af-ton, S. C. drying wind, from 7 o'clock, A. M. until 2 o'clock P. M. 866 lbs. gut fat 26 lbs. making together

He measured from the end of his nose, to the

From the end of his nose to his ears, only 9

Girth round the neck, close behind the ears, 5

Girth round the neek, close before the fore legs

Girth round the body close behind the fore legs feet 3 inches.

Girth round the body in the thickest part 7 feet 8 inches.

Height, 3 feet 2 inches. Breadth across the shoulders 2 feet 5 inches.

Age 1 year 8 months and 22 days.

In No. 41, Vol. 2, of the Farmer, I find an account of the weight of a Hog raised by Mr. Wheaton, in this county, extracted from the Arevidently been a mistake either in the original work, or in the extract; in the next page I find and the 8 is where the 3 should be, his true With respect to the Foxite potato, I can truly weight was 834 lbs. in which is included the say, that they deserve all the commendations I af fat.

Your's Respectfully, EPHRAIM BUCK.

THE FARMER.

BALTIMORE, FRIDAY, MARCH 14, 1823.

WAR IN EUROPE.

A late arrival at New York, brings news of War between France and Spain. The tone and attitude assumed by Spain, towards France and her un-holy allies, induces us to belive that Spain must have strong assurances of support from England, and of the co-operation of Portugal.— In that case, the war will be protracted, and the final issue of it very doubtful.-We shall soon see ted any successful competitor for the trouble of the shortest period afterwards, they are injured. the effect, which this new state of things abroad, will have on the price of American produce .-That effect will be greater, and more propitious for us, should England embark in the contest. What a satire on the boasted philanthropy of It is obvious that Mr. Johnston's hogs possess uncommonly valuable properties, and must be a great acquisition to the country. Importations died—say 850 lbs.* precisely apprized of any changes which may * A good guess this, as he turned out to weigh occur, in the prices of the commodities usually reported in the American Farmer.

> SEED-ROSE CUTTINGS &c. received lately for distribution-from Europe, and from five different states.

> Spanish Tobacco seed, varnish leaf, and mullen leaf, from Mr. Barkley, of Charles county, Md. Kite foot tobacco seed, from Dr. Kent, Prince Georges county, Md.

> *Persian melon seed, from Mr. Jay, of N. York. *Guinea Grass seed, from W. R. Bull, Esq. of Barnwell District, S. C.

> *Several varieties of Grape seed, and other seed from France, from Peter Minor, Esq. of Charlottesville, Va.

> Corn, which produced 136 bushels per acre, and a beautiful sample of Maple Sugar, from R. H. Rose, Esq. Silver Lake, Susquehanna Co. Pa. Bread and Hominy Corn, from Peter K. Davis,

> Esq. Warrenton, N. C. Cherokee rose cuttings and seed, and Magnolia seed, from Charles E. Rowan, Esq. of Charles-

"BRIGHTON AGAINST THE WORLD."

Henry Merwin, of Brighton, on a wager of cut and corded one cord of four foot wood in fifty five minutes!! Mr. M. selected two beach stout shrub, with blossoms much like that of the trees, about half a cord each, which he fell, cut, down low; for, when they get long stems and orange, and with a powerful smell. It is propa-split, and corded, in 55 minutes. This is an ingated from suckers, of which it sends out a great stance of despatch altogether unprecedented in the annals of chopping.

SIOLOGY OF PLANTS.

Middletown, Kentucky, Jan. 22d, 1823.

JOHN S. SKINNER, Esq.

discoveries and observations of Mr. John Bywater, ary member of the literary and philosophical society of New York, United States. This gen-1809, 10 and 11-and published them at Liverand curious theory, treated on in the following communication, more fully explained.

Mr. Bradbury when on his tour through the republican institutions, that he removed his the abode of their future generations. family to this country, and is residing in this

by, your friend, &c.

WM. CHAMBERS.

Observations on the nature of Animalcules, and principles of vegetable Physiology.

In my communication to you on the principles opinions, chiefly resting on the evidence of what I Having seen it observed by different writers, that the small capsules of the farina fecundans burst when they come in contact with water, and throw was induced to make some microscopical experin ents, under an impression that they containthe vegetable process. In these experiments my expectations were not disappointed, as the farina of most flowers gives out an abundance of animalcules, somewhat similar to the very small one we obtained in such vast numbers by the process of infusion. These results were obtained by putting a drop of water on a slip of glass, placed under the microscope, and then drop a little farina into the water; for, in a few seconds, a violent internal commotion commenced in the glutinous looking matter, that manifested a high degree of animation, and presented some very curious objects for the microscope: in order to ance and the water a dark blue. When this is str ams of beautifully animated matter; sometimes this matter will issue in straight lines, like streams of light, from which small portions of about in various directions: From other capsules, these small animals are emitted almost on every side, and render the water a speck of scintilating

Dear Sir-In your last communication to me These peculiar results will certainly afford an of facts, we have the strongest evidence that the you state, that you have not met with the late extensive field for microscopical inquiries; but process of vegetation chiefly depends on secreof Liverpool, on animalcula infusoria. and on the physiology, perhaps they partake of a higher class of agents. It may be difficult to conceive physiology of plants. Herewith I transmit you interest, as the circumstances attending these how they direct such an extensive process, yet a copy of one of his papers, as published in the discoveries evidently show, that small animals it is equally difficult to comprehend the nature of travels of the much famed English botanist John not only exist in, and extend their race with, that directing energy, by which spiders form Bradbury, F. L. S., corresponding member of vegetables, but in all probability are the real their various webs, or bees construct their curious the Liverpool philosophical society, and honor-sources of vegetable life. That those isolated hives:—it must be the unerring influence of collections of small beings are the chief agents divinity, which instinctively impels and guides in forming, by their secretions and instinctive these wonderful operations. Altho' I had often tleman performed his travels in America in influence, the embryo of a new plant, does not viewed the larger animalcula infusoria, and conappear improbable; for if an accumulation of sidered them as congeries of still smaller animals, pool in 1817. In this work you will find the new them can construct such delicate vegetable for yet I had no idea of the form and character of mations as the branching varticella, when acting the little agents which compose these congeries, under their aquatic character, why may we not until I examined them by a similar light to that suppose them capable of instinctively construct applied to the farina, and then it was evident United States, became so much attached to our ing the embryo of a new vegetable which is to be that numerous small bodies, similar to those ob-

Some time ago I mentioned to you, it was probable that the beautiful plumage of the feathered tribe owed its designs and variety to an agency of this kind, as the various phenomena attending the growth of feathers bear such a strong analogy to many of the vegetable phenomena: since then I have found, by inspection, that these little opaque bodies are inclosed in almost every part of the feather.

These, and numerous other results, open a wide field for investigation; but several circumstances have induced me to waive the inquiry for the present. Nevertheless, should you meet with any new and interesting facts in America, I shall be glad if you will send me a detail agreeably to your promise, the first opportunity, and believe me your's truly,

20 CRAB OR CROP GRASS.

Barnwell Dist. Duncansville, 27th Jan. 1823. Dear Sir,-In No. 41 of the American Farmer 4th volume. page 327, I notice the request of John D. Legare, Esq. through the medium of your paper, to state what method has been pursued with the greatest success, for obtaining a crop plough, without mould boards, this would be preserved, or crop grass, when cultivated by itself; ferable to a hoeing, inasmuch that it would not small hole in the same time, as soon as cold weather and rain; after shearing, rub them well with soft soap; they will be clear and clean three weeks after plough it with a small flake in a few days. If the vermin adheres to the fleece, take a flour barrel without heads, dig a of crab, or crop grass, when cultivated by itself;

been the produce.

Having made two little experiments, I offer them to you—probably it may be some satisfaction to your correspondent. My object was to hoeing may answer, but I'd remark, it makes procure a crop of the crow foot grass, to make this difference, in the first place, it is more exhay. I had a small piece of ground less than a peditious, for a boy and horse can plough at any quarter of an acre, (as well as I remember about seven eights of 1 of an acre,) it was good pine in a day, and I think it is a common allowance to QUERIES RESPECTING A NEWLY INland, a little cow-penned, but not rich; this ground give a hand only one acre of oats per day, as a was ploughed, then cross ploughed, and harrowed task, or day's work, I have never given more. over nicely; I then had the ground laid off, across In the second place, I believe ploughing oats will the harrowing, 12 inches asunder, say in drills, have a tendency to promote a greater yield; this with what we term a bull tongue plough; this was done in the latter part of May 1821. I then plantas soon as the oats is ripe, (and let the planter not of the following resolutions, particularly as to the ed, soon after, about two quarts of crow foot grass wait till it be dead ripe,) have it cut, and have price, probable bulk and weight of the machine; seed, in those drills: and then covered it; it re-your ground as soon after as possible, ploughed, where, or of whom to be had, will be thankfully mained some time in the ground, so long, that and cross ploughed, then raked with a horse received.

cut the last of August, or early in September; the grass. If this plan was pursued, I have no doubt reason I had it cut so soon was, that I was under you'd not only obtain a full crop of oats, but also that they vary in other respects, as wen as in reason I had it cut so soon was, that I was about 3000 lb. of good hay per acre, and should you even themselves are composed of a congeries of disappointed, hence I infer (also from other experiments) it is always best to expect one crop correspondent, you can dispose of it in any way only from the ground, without it should be such you think proper. substances; for a little black ink or milk put crops, as would have sufficient time to mature on a slip of glass, or a bit of raw sugar dropped after the reaping of the former; this may be supposed, that I would be for encourging, or tion; nor will a scientific brewer find a small rather advising second cropping; if the ground is good you can effect two crops, if not you can make it good by a plenty of manure, which is easily made these agents are to be met with in fine ale, as the prosper. I have a little digressed, but to the point; greater part of them make their escape with the this grass was cut, three fourths at least was crab barm. and spread thinly before my door, say in a large yard, it received the sun for three days, being also frequently turned, it received the dew of one night only, I examined it and thought it was sufficiently cured; had it housed, and six days after, I took two fellows with me and weighed it, the weight lamp oil, and rub it on when the hog is clean, it was eight hundred weight from the above piece will destroy both lice and knits. Hogs should of ground; I believe had I deferred having it cut be kept without litter, except in extreme cold a month longer, say October, it would have been weather, when clean straw should be furnished at least 1000 lbs. it was as good hay and as bright twice a week. In summer hogs should at all times a colour as I would ever desire on my plantation. have water where they can wallow, and they will

and one of Horse Dung, for plastering round the Grafis; and coarse soft twine, well waxed with Bees wax, for tying up the Grafts .- PHIL. PAP.

The following paragraphs are selected from a British review of a recent "Journal of a Horticultural Tour through Holland, the Netherlands,

"The greatest novelty in Brussels, to our tourwith all its decorative Scotticisms, for the satisfaction of our readers:

' In a lane hard by the green and fruit-stalls, we fell in with the Frog-market, which was a novelcake, by the Yankees called slapjacks. The oat meal is calculated for puddings, and is a sub-danger from frosts are over, and the fruit ripen- and cans, and are sold by tale. The frog-women the Edinburg fish-market, and, like them, they prepare the article for the purchaser on the during the summer months was subsisted exclusively on clover. The brother of Mr. C's. fine shells with her gully, the frog-woman shows no hog was killed at 15 months old, and weighed less adroitness, although more barbarity, in the 555, not having been raised in a stye—any genexercise of her scissors: with these she clips off the hind limbs (being the only parts used,) flaying them at the same time with great rapidity, ter of this article cannot forbear the expression and sticking them on wooden skewers. Many the hundreds of the bodies of the frogs, thus cruelly dium of the Agricultural Society, of which he is mangled, were crawling in the kennel, or lying in a member, a communication of his method of heaps, till they should be carried off in the dust raising hogs.

"We may mention, that the species thus used as food (Rana esculenta) has never been observed by us as a native of Scotland, though it is marked in natural history works as a British species. It is generally larger, and more arched on the back, than our common frog (Rana tempordria;) and the colour is rather green, while ours is rather yellow. We noticed, however, many specimens, perhaps males, marked longitudinally over the back with three faint yellow lines."

"Our worthy Caledonians do not inform us whether they ventured to taste a pasty made with these hind quarters, after the scene they witnessed. For our own parts, having been accustomed to contemplate nearly as much cruelty practised by the females who sell and skin live eels in London, we were easily prevailed on to partake of a frog pasty in Paris; and, in common with several of our countrymen who tasted it at the same table, we pronounced it to be, decidedly, the best of the French dishes. Frogs, however, are expensive, and a rarity even in Paris; and are only seen at the tables of the opulent."

NATIVE RACE OF CATTLE.

Mr. Asa Rice, jun. of Shrewsbury, in Worcester county, (Mass.) has brought to the Brighton Market the following cattle, all of his own raising and fatting, weighing, after being slaughtered, as follows:

A Steer, 4 years old, Feb. 10, 1821, slaugh- lbs. tered on the 11th October, same year, Slaughtered Feb. 2, a Steer, 4 years old,

the 12th April, Slaughtered Feb. 2, A Cow 13 years old last spring, Slaughtered Feb. 2, A Heifer, 3 years old 1091

14 th May, These cattle were wholly of native breed.-The steers were weaned at 12 weeks old, and fed with nothing but hay and grass until they entered their fifth year. The Cow brought a calf at two years old, and another last spring; and spoiled her.

From the Richmond, Va. Compiler. MESSRS. EDITORS,

The following are the weight and dimensions of a hog raised by Mr. Bowler F. Cocke of if he was beat by a woman, he would never again Corles Neck, in this county. Gross weight, 710 revisit his paternal mansion.—ibid. pounds, net weight 630; length 7 feet 8 inches, height 3 feet 44 inches-weight of one ham 78 lbs.; shoulder 85 lbs.; middling 86 do.; head 54 do. 32 months old.

hog lately the subject of a paragraph in the sions near Wotton-under-Edge, in the county of Richmond Enquirer, yet deserves to be noticed Gloucester, between the heirs of Thomas Tal-lof 4d.

GREAT CROP.

Messrs, J. and M. Pratt, of Eaton, Madison county, N. Y. raised the present year, from three acres of ground, the astonishing quantity of four hundred and ninety four and a half bushels of Indian corn; an average of one hundred and seventy two and a half bushels to the acre.

Should like to see the vouchers !! Edit. Am. Farmer.

THE NEWLY IMPORTED AMERICAN HORSES.

The public were informed of the speed of two American trotters, the property of Mr. Aldridge, some months ago, and it seems two others lately arrived, are superior in speed, and equal to 17 miles in one hour. They are the property of a gentleman named Beningborough; one of them was matched to do eight miles in half an hour on the Cambridge road on Thursday, and to carry 11 stone. The horse is an iron gray, rat-tailed, and is 16 hands high. The match was for 100 sovereigns at a week's notice, and the horse did the first mile in three minutes 30 seconds; the second, three minutes 29 sec.; third, three minutes 26 sec.; fourth, three min. 36; fifth, three min. 32; sixth, three min. 50; seventh, three min. 40; and eighth, three min. 52; making in the whole, 28 minutes and 55 seconds. The horse broke once in the sixth mile. The other horse was matched to trot 17 miles in one hour, for 200 sovereigns, on the same road.

Glasgow Herald.

A match of rather a novel nature was lately made betwixt two gentlemen of this city, which was decided on Saturday, on the Edinburgh and Glasgow roads, near Westcraigs. A young woman from the neighbourhood of Queensberry was to run fifteen miles against any Lanarkshire at two years old, and every year since but the man. A lad turned out, in honor of the country, last. She was milked last winter, turned out in from Dalserf. For the first eight miles the lady the spring, thin in flesh, and began mealing the took the lead, and finished them within the hour, 1st of October last. The Heifer brought a calf but at this point her opponent, who had hitherto but at this point her opponent, who had hitherto courteously kept in the rear, shot past. Upon was dried the last of July, and turned out, as this she made a great effort, and resumed her pothin as any other cow, and was fattened on ac-count of a blemish which would eventually have woman fell down in such distress that the gentleman who backed her lost all sight of his bet in the apprehension he had for her life. The lad completed the fifteen miles in seven minutes within the two hours, having run the last mile in five minutes. He had previously declared that revisit his paternal mansion.—ibid.

The longest law-suit which ever took place in England, or indeed, in any part of the world, arose This hog, though not so large as the Mammoth in a litigated question respecting certain posses-

are arranged on forms like the oyster-men in by the friends of domessic economy. Mr. bot, Viscount Lisle, on the one part, and the was instituted towards the end of the reign of Edward IV. and was still pending in the reign of James I. at which time a compromise took place between the parties—thus embracing a period of

> =06 COURT OF KING'S BENGH, JAN. 4.—Blair and Another v. Thorn.—This was an action by Messrs. Blair and Plimpton, seedsmen, against a farmer of Essex, to recover £13 10s. being the price of rye-seed sold in April, 1820, by sample. The defence was that the seed was entirely valueless, not a blade of grass having arisen from the land where it was sown, and that it had been bought as seed then coming in a hoy from Kent-Verdict for the defendant.

HOUSEHOULD SERVANTS, IN THE REIGN OF QUEEN ELIZABETH.

Servants in the sixteenth century, were held in a greater degree of subjection than they are in the present; as will appear by the following very curious list of penalties kept by the ancestors of an English Baronet, 1565-6, for the purpose of regulating the respective duties of the Household Servants.

I. That no seruant be absent from praier, at morning or euening, without a lawful excuse, to be alleged within one day after, vpon paine to forfiet for euery tyme, 2d.

II. That none swear anie othe upon paine for

euery one, 1d. III. That no man leave anie doore open that he findeth shut, without there bee cause vpon

paine for every tyme, 1d.

IV. That none of the men be in bed from

Our Lady-day to Michaelmas, after 6 of the clock in the morning; nor out of his bed, after 10 of the clock at night : nor from Michaelmas to Our Lady-day, in bed after 7 in the morning, nor out after 9 at night, without reasonable cause on paine of 2d.

V. That no man's bed be vnmade, nor fire or candle box vncleane, after 8 of the clock in the

morning, on paine of 1d.

VI. That no man commit any nuisance within any of the Courts, vpon paine of eury tyme it shall be proued, id.

VII. That no man teach anie of the children

any vnhonest speeche, on paine of 4d. VIII. That no man waite at the table without a trencher in his hand, except it be vpon

some good cause, on paine of 1d. IX. That no man appointed to wait at my table bee absent at meale, without reasonable

cause, on paine of 1d.

X. If aine man breake a glasse, hee shall aunswer the price thereof out of his wages: and if it bee not known who breake it, the butler shall pay for it, on paine of 12d.

XI. The table must be couerred halfe an houer before 11 at dinner, at 6 at supper, or before on paine of 2d.

XII. That meate be readie at 11 or before at continued at an unnecessarily quick pace, and dinner, and 6, or before, at supper, on paine of

> XIII. That none bee absent, without leave or good cause, the whole day, or anie part of it, on paine of 4d.

XIV. That no man strike his fellow on paine of losse of service; nor reuile or threaten, or provoke one another to strike, on paine of 12d.

XV. That no man come to the kitchen without reasonable cause on paine of 1d. and the cook likewise forfeit 1d.

XVI. That none toy with the maids, on paine

daie, nor broken hose or shooes, or doublett bers, may not be diminished. without buttons, on paine of 1d.

XVIII. That when anie stranger goeth hence, the chamber be dressed vp againe within 4 hours after, on paine of 1d.

XIX. That the hall be made cleane energy daie, by eight in the winter, and seaun in the summer, on paine of him that should doe it, 1d.

XX. That the court-gate be shut each meale,

on Frydaie after dinner, on paine of forfeyture of euery one whom it shall belong vnto, 3d.

All which summes shall be duly paide each quarter-daie out of their wages; and bestowed on the poor or other godly vse.

THE FARMER.

BALTIMORE, FRIDAY, MARCH 21, 1823.

THE EDITOR TO HIS PATRONS.

In closing the fourth year of my Editorial labours, appropriated during the hours of leisure, from official duties, to the agricultural interests without a single pecuniary or intellectual contri- years. butor-at the sole hazard, and relying exclusively on the labour of the Editor. It is now written for and paid for, with a degree of ability and punctuality, as honorable to its patrons, as it is agreeable and flattering to the Editor. Many articles on very important subjects, not hitherto fully, if at all discussed, are in preparation for the next volume, intended chiefly to demonstrate the routes, and the resources for Internal Improvements, over the face of the country generally, and the principles on which they should be conducted; and also to call attention to various economical improvements in the construction of farm machinery, and buildings, and to point out new objects where old ones have become unprofitable, by reason either of increased supply, or lessened demand, and the processes to be followed in their cultivation. Looking at my supply of new books and tracts, lately received from Europe, with other materials, the suggestions of domestic experience, I can safely stipulate that the next volume, without treating of subjects already explained, will be as valuable to the practical farmer, and more so to his growing children, than any previous one.

Respectfully, JOHN S. SKINNER.

The Editor flatters himself that as his pa- Hay, \$10. per is taken purely for the sake of reading it, and that too, chiefly by respectable landholders; so at 5 a 3 to 7 a 3 -do. do. New 4 a 10-One hhd. no paper in the Union, is more punctually paid fine yellow from Calvert County, raised by Mr. for: he earnestly requests that those who have Mordica F. Smith, sold at \$20-2 do. fine span-complied with the terms of subscription will accept his thanks, and remember, that according Ridgley, sold at \$18. and not opened during dinner and supper, without just cause, on paine the porter to forfeit for every tyme 1d.

XXI. That all stayrs in the house, and other to week.—The Editor himself, must have the pecially as to the part that England will take in means of supporting and educating his family, to said terms, their subscription is now due for the fifth volume. The Printer, the Paper Maker, the workmen, must all be paid, from week grain. The next will be more decisive, estroyed that need shall require, bee made cleane means of supporting and educating his family, the great game of destroying human life—we means of supporting and educating his family, the great game of destroying human life—we and defraying househould expenses—which in a hope this auspicious change, in the prospects of town cannot be defrayed by promises—nothing Farmers, will induce them not only to hold on but money will do; and when the subscriber upon their old friend the American Farmer, complies with the terms, by paying the Editor but to send to it the names of some of their in advance, he only trusts him for the amount of good neighbours. a single subscription, and four years experience has proved if the Editor live, the service will be rendered-he requests moreover, that he may be of a subscription without the money. This jour- FRANCIS MERCER, situated on West River, nal may fail, for want of good subscribers, but in Ann Arundel county.
